1. Introduction

1.1 Checklists

Checklists are comprehensive lists covering all species of a certain group known to occur in a specific area. They are of great importance in providing an overall view of an area's diversity, its species composition and its biological history.

In the field of biology, checklists have a long-standing tradition stretching back to the early naturalists. The list functions as a living document; species being added or, in some cases, removed as time passes and new species are discovered or established species become extinct or are merged with other species. As science progresses there are also changes in taxonomy, especially following the major advances in genetic research. For some groups this means that over time the same species can have several, sometimes as many as twenty, synonyms in the literature. This information is also added to the checklists and enables researchers to track the occurrence of a species through historic literature. At times scientists and researchers work consecutively on the same checklist ensuring it is up to date both in terms of species composition and nomenclature. In this way they make sure that it can be used in the present although it has its roots a hundred years back.

1.2 HELCOM checklist of Baltic Sea species

In 2009, the Helsinki Commission was tasked with creating a comprehensive Red List of Baltic Sea species. One of the first steps in compiling such a list was to establish which species are present in the Baltic Sea. To achieve this, expert teams were set up to prepare checklists for each of the following groups: macrophytes, benthic invertebrates, fish and lamprey species, waterbirds and marine mammals.

To date most checklists have concentrated on a particular group of species. For example, checklists have been compiled for species within a certain family or order, or for species that are found in a particular region (e.g. within certain national borders). The HELCOM checklist of the Baltic Sea species goes further in that it aims to cover all macro-species simultaneously and the Baltic Sea in

its entirety. In this sense the HELCOM checklist is unique.

The HELCOM checklist compiles information on the taxonomic group, the scientific name and author, synonyms, a minimum of one valid taxon code in taxonomic databases or other taxonomic reference, distribution data and a minimum of one reference confirming the occurrence (historic and/or present) of the species in the Baltic Sea.

If a species is included in the HELCOM checklist, it does not automatically mean it was present in the Baltic Sea at the time the checklist was published. Some observations are historical and the only way to confirm the presence of a species is to undertake new inventories in the area previous occurrence

1.3 Work on the checklists

In the HELCOM checklist, the Baltic Sea species have been divided into five groups: Macrophytes, Benthic invertebrates, Fish and lamprey species, Baltic breeding birds, and Marine mammals. Each group was assigned its own team of experts. The teams were comprised of experts from countries all around the Baltic Sea and they worked to collect data from the whole Baltic Sea area. This document combines the checklists that were compiled by the experts and functions as the HELCOM checklist of Baltic Sea species. The experts in each team are listed at the start of the corresponding chapters.

Although other checklists have also focused on the Baltic Sea and its species (e.g. Nielsen et al. 1995), these lists have all been regional and/or focused on a specific group of species. The existing checklists, as well as literature studies, databases, personal communications and data provided by the various Baltic States, have all been used to draw up the five checklists reported here. For transparency, each observation included in the present checklists has been allocated a reference code and the corresponding reference can be found in either the relevant documentation section (see Chapters 2 to 6) or by contacting the experts listed in Annex 1. Because the starting point for each checklist is slightly different, some aspects of the checklists

may differ but the general information is the same in all checklists.

It is important to remember that the Baltic Sea is not a uniform body of water providing the same living environment but rather a combination of several different types of habitats. As a result, and for the purposes of this study, the Baltic Sea was divided into sub-basins on the basis of seabed shape. For each sub-basin, abiotic factors such as depth and water exchange differ and create sub-basin specific environments based on chemical and physical properties.

To make the checklist more exact, the distribution data are presented by sub-basin (Figure 1). For each sub-basin, the reference for the observation in that area is available through the experts named

at the start of Chapters 2 to 6. The aim has also been to separate recent and older records. In some cases, amendments have been made to the information in the checklist. For example, more specific information can be found in some checklists (such as the nature of the species' occurrence in a specific area; breeding, occasionally breeding etc.) or the extent of the area used to supply distribution data may differ (as is the case for birds). More information on such amendments is given in the relevant documentation section.

1.4 Using and updating the checklist and distribution data

This report is the foundation document for the Checklist of Baltic Sea Macro-species and includes all background information. A separate digital checklist in the form of a spreadsheet will be kept up to date by a regular review at a minimum of every five years. This will make use of new data as they become available and will record changes in taxonomy and distribution. The digital checklist will contain a log of updates made to the checklist since the present document was published. The date on the downloaded file will indicate the date of the last update.

For people requiring the most recently updated version of the checklist or part of the checklist only, there are separate Excel versions available for download via the HELCOM website (www.helcom.fi). Suggestions, changes or additions to the checklist are warmly welcomed and all comments should be sent to the HELCOM Secretariat. These will be reviewed by the relevant experts before action is taken.

This foundation document contains a printable version of the HELCOM checklist. The complete checklist (as of November 2011) can be found in Chapter 7, while Chapters 2 to 6 describe the documentation and data sources used by each team of experts in compiling the checklist.

Reference data for the checklist are available by contacting the expert team representative for the country and group in question, the chair of the team, or the HELCOM Secretariat.

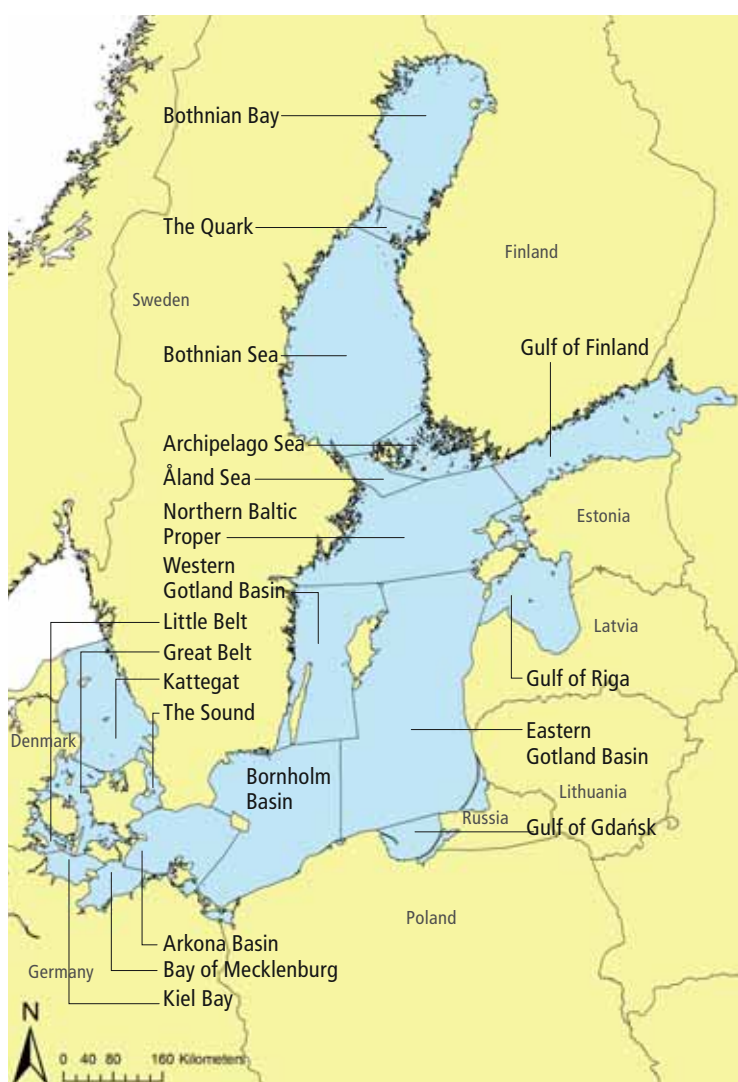

Figure 1. Baltic Sea sub-basins used as the basis for compiling distribution data for the five checklists.

1.5 Summary of the checklist entries

The HELCOM checklist contains 2730 species. The majority of the species, a total of 1898, belong to the benthic invertebrate group. Of the remaining 832 species, macrophytes, vascular plants and bryophytes make up a substantial proportion, followed by the fish and lamprey group. The bird checklist only includes birds breeding in the Baltic and so contains relatively few species. All Baltic marine mammals are included on the list of mammals, resulting in five species in total (Figure 2).

A clear trend in biodiversity is evident for all groups, with the number of species in an area decreasing along a south to north gradient (Figure 3). An exception occurs in the Gulf of

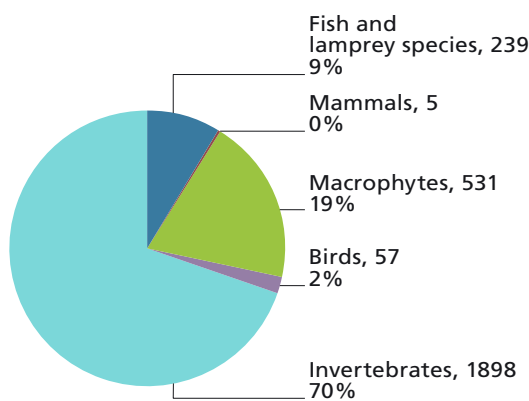

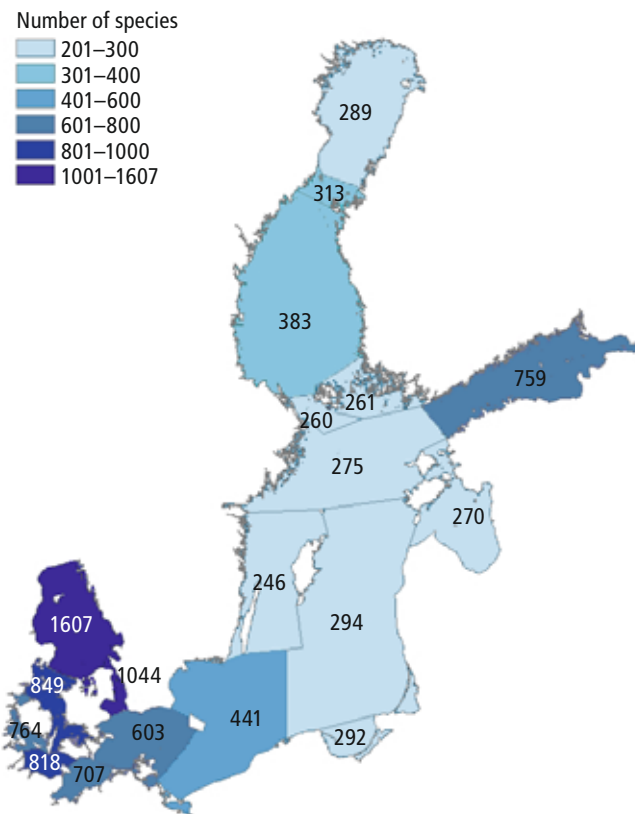

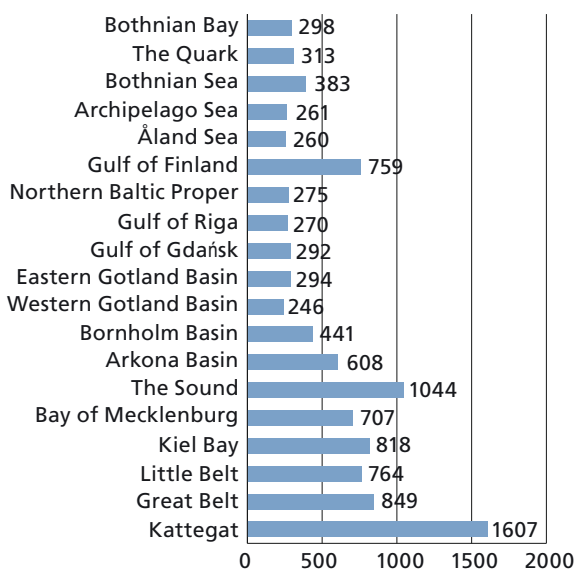

Figure 2. Total number of Baltic Sea species per group.

Finland where the powerful salinity gradient and shallow waters provide a varied living environment with an influx of freshwater species and insect larvae from the Neva estuary. The geographical division of species per group can be found in the relevant documentation section.

Number of species per sub-basin

Percentage of species per sub-basin as a proportion of the total number of species

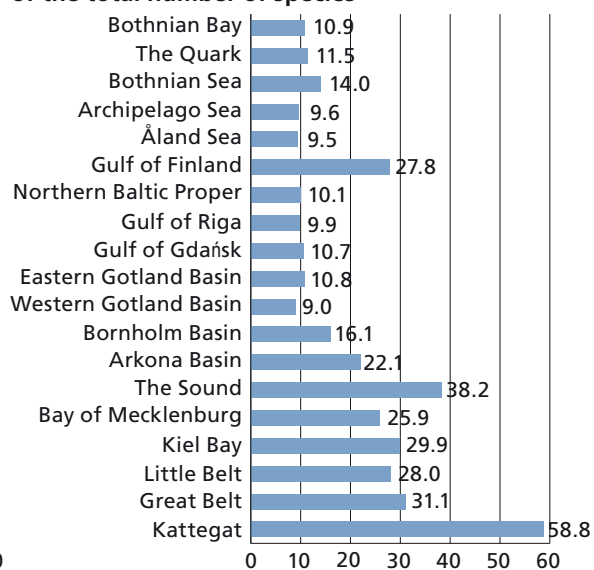

Figure 3. Number and distribution of species per sub-basin.

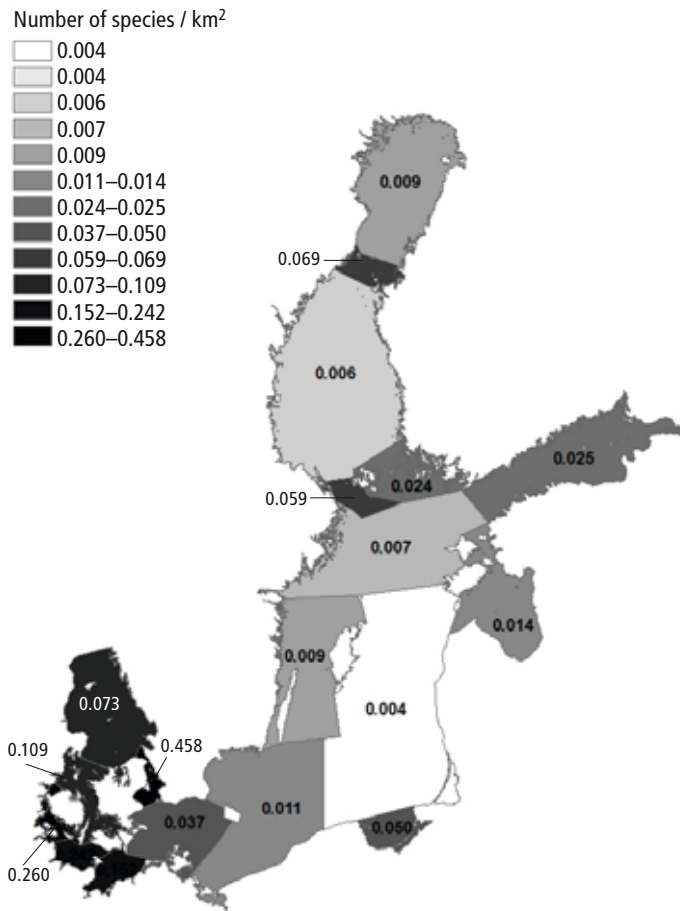

Figure 4. Diversity of macro-species per sub-basin.

Table 1. Macro-species diversity per sub-basin in descending order.

Sub-basin	km ²	Total no. of species	Species/km ²
The Sound	2278	1044	0.458
Little Belt	2942	764	0.260
Kiel Bay	3382	818	0.242
Bay of Mecklenburg	4636	707	0.152
Great Belt	7765	849	0.109
Kattegat	22102	1607	0.073
The Quark	4509	313	0.069
Åland Sea	4433	260	0.059
Gulf of Gdańsk	5806	292	0.050
Arkona Basin	16502	603	0.037
Gulf of Finland	29901	759	0.025
Archipelago Sea	11077	261	0.024
Gulf of Riga	18796	270	0.014
Bornholm Basin	41970	441	0.011
Bothnian Bay	33224	298	0.009
Western Gotland Basin	27876	246	0.009
Northern Baltic Proper	41114	275	0.007
Bothnian Sea	63650	383	0.006
Eastern Gotland Basin	74985	294	0.004

The sub-basins all differ in size. When the total number of species per sub-basin is compared to the size of the sub-basin it is clear that the smaller sub-basins near the western border of the Baltic Sea have the highest number of species per unit area (Table 1). These are followed by the UNESCO world natural heritage site of The Quark and the Åland Sea, both much further north. When the species diversity of these areas is compared to that of adjacent areas there is an almost ten-fold increase in the border areas (Kattegat/Great Belt/Arkona Basin or Bothnian Sea/The Quark/Bothnian Bay). One of the common factors for these areas is that they function as narrow border zones between two larger bodies of water with quite different characteristics, such as salinity and average temperature. The actual number of species differs widely between these areas but the same effect is evident.

Other factors may also affect the mean species diversity per unit area. The amount of data collected in the various sub-basins affects the number of species found simply because the possibility of finding more species increases as more data are collected. Nevertheless, effect of the border zones is still apparent.

2. Checklist documentation and distribution data for Baltic Sea macrophyte species

The checklist for Baltic Sea macrophyte species compiled within the HELCOM Red List project currently includes 531 taxa of macroalgae, aquatic vascular plants, charophytes and bryophytes. The list also contains 3052 of the most common synonyms, variations or subspecies. These data make it possible to establish the distribution of each species across the Baltic Sea. Figure 5 shows species diversity per sub-basin.

2.1 Expert Team

Chair: Georg Martin (Estonia)

Paulina Brzeska (Poland), Martynas Bučas (Lithuania), Anna Doronina (Russia), Karin Fürhaupter (Germany), Marika Gerb (Russia), Elena Glazkova (Russia), Vadims Jermakovs (Latvia), Gustav Johansson (Sweden), Hans Kautsky (Sweden), Kirsi Kostamo (Finland), Nikolay Kovalchuk (Russia), Kaire Torn (Estonia).

2.2 Taxonomy

The taxonomy of the macrophyte species follows the World Register of Marine Species (WoRMS www.marinespecies.org, last edit: 2 February 2011). The taxonomy of species not included in WoRMS (72 mainly freshwater vascular plant species) follows national or international databases in the following order: German FloraWeb (www.floraweb.de) > Integrated Taxonomic Information System (ITIS; www.itis.gov) > World Checklist of Selected Plant Families (WCSP, 2011 <http://apps.kew.org/wcsp>).

Taxonomically the checklist contains nearly exclusively species. Only in four exceptional cases is the genus listed (*Batrachospermum*, *Gymnogongrus*, *Spirogyra*, *Zygnema*). Although records for subspecies or variations exist for several countries, these are compiled under the respective species level, with the subspecies/ variation listed within the 'synonym' category.

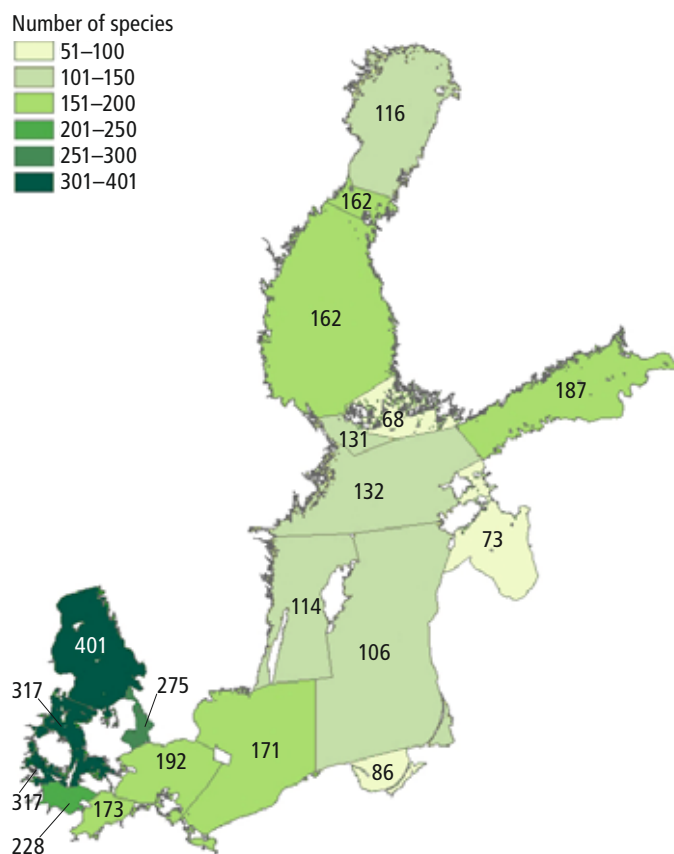

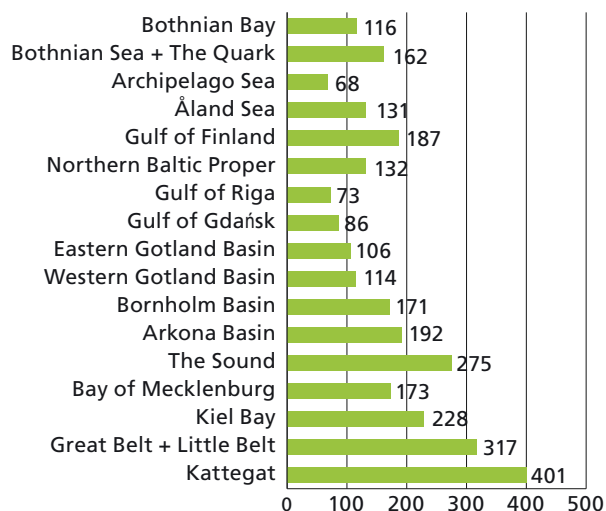

Figure 5. Number of macrophyte species per Baltic Sea sub-basin.

2.3 Defining parameters

The aim has been to compile a checklist valid for the Baltic Sea area as defined by HELCOM (see Figure 1). Species included in the macrophyte checklist were required to fulfil the following criteria:

1. All species should be listed in at least one of the international databases given in Section 2.2 to verify the taxonomic reference.
2. All species should form stable populations in brackish waters with a minimum salinity of at least 0.5 (identification of 'borderline' cases with freshwater and/or land environments).
3. Records for all species must be geographically located within the Baltic Sea itself and not just in nearby ponds, rocky pools or rivers.
4. Species identification must be reliable. Therefore, species with a very low number of records will be checked by macrophyte experts and doubtful identifications will be excluded.

2.4 Distribution

The checklist includes presence/absence data for the Baltic Sea sub-basins. The sub-basins used in the HELCOM Red List project are shown in Figure 1. The total number of species per sub-basin is shown in Figure 3.

For the macrophyte checklist a few modifications were necessary:

- Great Belt and Little Belt were combined
- Bothnian Sea and the Quark were combined
- All records from the island of Bornholm were included in the Bornholm Basin
- All records from the island of Gotland were included in the Western Gotland Basin.

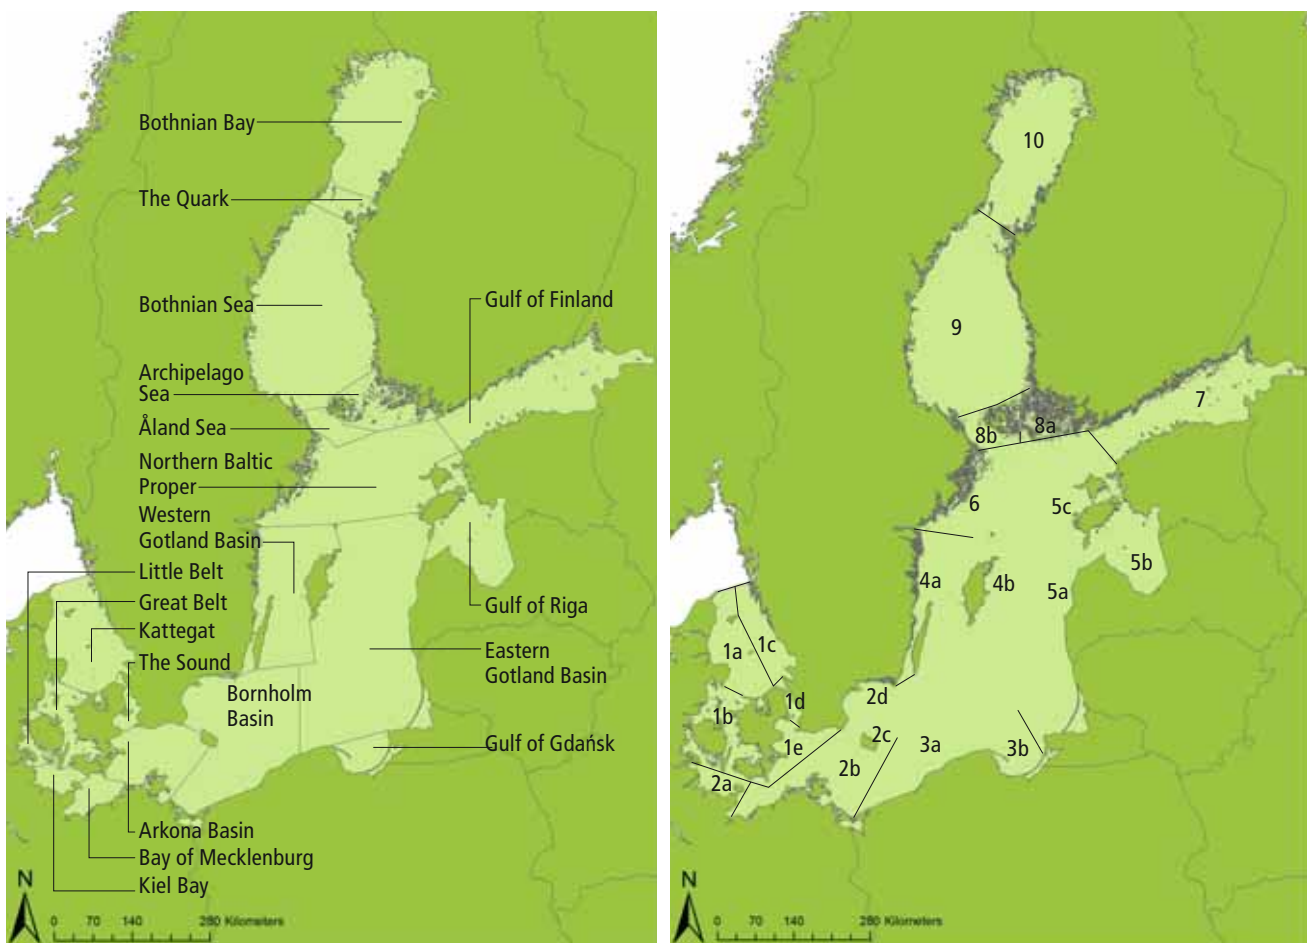

Figure 6. Baltic Sea sub-basins used for the HELCOM checklist (left) and the geographical areas used by Nielsen et al. (1995); the publication used as the basis for data compilation (right).

2.5 Data sources

The data sources include five databases, three publications with transnational information, and many national publication sources (published, unpublished reports and/or personal communications).

For macroalgae, the distribution index by Nielsen et al. (1995) formed the basis of the HELCOM checklist as it includes all distribution information for macroalgae within the Baltic Sea before 1995. However, there were some differences between the sub-regions used by Nielsen et al. (1995) and those used in the HELCOM Red List project. Records from the Nielsen et al. (1995) database were transferred into the HELCOM database according to the description given in Table 2 and Figure 7.

2.6 Checklist

The checklist for Baltic Sea macrophyte species is presented in Chapter 7, Table 7.1. This gives the higher taxonomic group, the valid scientific name (with authors and year), synonyms/variations or subspecies, taxon ID codes from several databases (Aphia-ID = WoRMS Code, TSN = ITIS Code) and distribution by sub-basin.

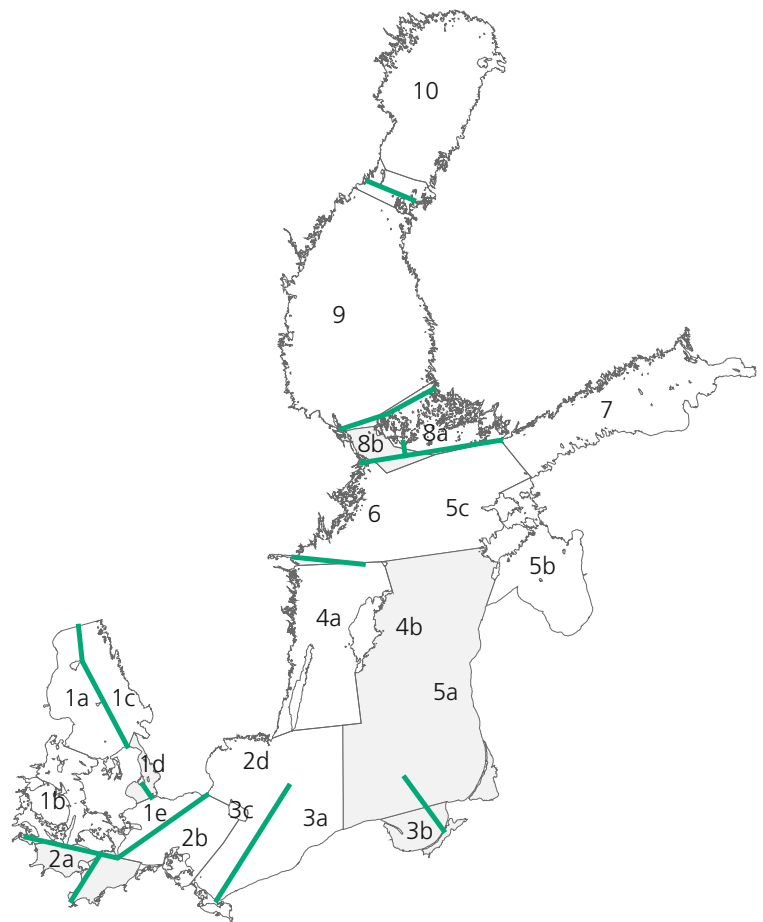

Figure 7. Baltic Sea sub-basins used in the HELCOM Red List project (thin lines) and sub-region borders used by Nielsen et al. (1995).

Table 2. Adjustment of macroalgae distribution data reported by Nielsen et al. (1995) to the Baltic Sea sub-basins used in the HELCOM Red List project.

Baltic Sea sub-basins	Countries responsible	Nielsen et al. (1995) sub-region	Comments
Kattegat	Denmark*, Sweden	1a and 1c	
Sound	Denmark*, Sweden	1d and 1e	Sub-region 1e extends further southeast compared to Sound, but the number of erroneous records generated by this difference is most likely to be low.
Great Belt + Little Belt	Germany, Denmark*	1b	
Kiel Bay	Germany, Denmark*	2a	Sub-region 2a does not coincide with Kiel Bay exactly. The references of Nielsen et al. (1995) have been checked and records compared to the Kiel Herbarium and Kaminski records (confirmed records from Kiel Bay = N95 2a_KB). Records that have not been confirmed have been kept, but are marked in red (N95).
Bay of Mecklenburg	Germany	2b	Sub-region 2b is much larger than the Bay of Mecklenburg. The references of Nielsen et al. (1995) have been checked and records compared to the Kiel Herbarium and Kaminski records (confirmed records from Kiel Bay = N95 2a_MB).
Arkona Basin	Germany, Denmark*, Sweden	1e and 2b	Sub-region 2b is much larger than the Arkona Basin. The references of Nielsen et al. (1995) have been checked (confirmed records from Arkona Basin = N95 1e and N95 2b_AB).
Bornholm Basin	Germany, Denmark*, Poland, Sweden	2c, 2d and 3	Sub-region 3a extends further east compared to the Bornholm Basin, but the number of erroneous records generated by this difference is most likely to be low. All coastal waters of Bornholm were included in the Bornholm Basin.
Gulf of Gdansk	Poland, Russia	3b	
Eastern Gotland Basin	Estonia, Lithuania, Latvia, Poland	5a	
Western Gotland Basin	Sweden	4a and 4b	All coastal waters of Gotland were included in the Western Gotland Basin.
Gulf of Riga	Estonia, Latvia	5b	
Northern Baltic Proper	Estonia, Sweden	5c and 6	
Gulf of Finland	Estonia, Finland, Russia	7	
Archipelago Sea	Finland	8a	
Åland Sea	Finland, Sweden	8b	
Bothnian Sea + Quark	Finland, Sweden	9	
Bothnian Bay	Finland, Sweden	10	Sub-region 10 extends further south compared to Bothnian Bay, but the number of erroneous records generated by this difference is most likely to be low.

* Information compiled by project manager Tytti Kontula (HELCOM) and/or Karin FÜRhaupter (Germany) as no Danish expert took part in the expert team.

3. Checklist documentation and distribution data for Baltic Sea benthic invertebrate species

The checklist for Baltic Sea benthic invertebrate species compiled within the HELCOM Red List project currently includes 1898 macrozoobenthic species and their most common synonyms. This is the most diverse group in the HELCOM checklist and by far the largest. Figures 8 and 9 show

species diversity per sub-basin, as well as 13 additional sections of coastline such as bays, lagoons and estuaries (see Figure 10 for the locations of the additional coastal sections). Figure 10 shows the distribution of species diversity per sub-basin.

Figure 8. Number of benthic invertebrate species per Baltic Sea sub-basin, excluding species present in the additional coastal sections.

Number of species

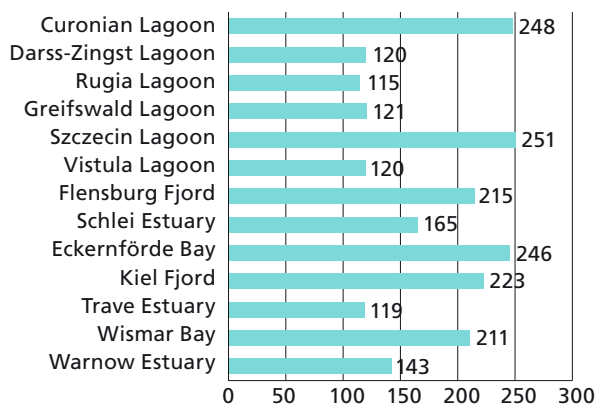

Figure 9. Number of benthic invertebrate species per additional coastal section.

3.1 Expert team

Chair: Anna Karlsson (Sweden)

Piotr Gruszka (Poland), Kristjan Herkül, (Estonia), Ari Laine (Finland), Alexey Maximov (Russia), Kerstin Schiele (Germany), Michael Zettler (Germany).

3.2 Taxonomy

The taxonomy of the benthic invertebrate species follows international taxonomic databases or other sources in the following order: the World Register of Marine Species (WoRMS www.marinespecies.org November 2010) > the Integrated Taxonomic Information System (ITIS; www.itis.gov) > BioLib (Biological Library; www.biolib.cz) > BioSystematic Database of World Diptera (BDWD; www.sel.barc.usda.gov/diptera/biosys.htm) > Fauna Europeae (www.faunaeur.org) > ZipcodeZoo (<http://zipcodezoo.com/>) > other sources. Codes from BioLib, BDWD, Fauna Europeae etc. have only been acquired for those species that could not be found in the WoRMS or ITIS databases

3.3 Defining parameters

Species included in the benthic invertebrate checklist were required to fulfil the following criteria:

1. All species should be listed in at least one of the international databases given in Section 3.2 to verify the taxonomic reference.
2. All species should form stable populations in brackish waters with a minimum salinity of at least 0.5 (identification of 'borderline' cases with freshwater and/or land environments).
3. Records for all species must be geographically located within the Baltic Sea itself and not just in nearby ponds, rocky pools or rivers.
4. Species identification must be reliable. Therefore species with a very low numbers of records will be checked by benthic invertebrate experts and doubtful identifications will be excluded.

3.4 Distribution

The checklist includes presence/absence data for the Baltic Sea sub-basins. The total number of benthic invertebrate species in each sub-basin is given in Figure 8. The sub-basins used in the HELCOM Red List project are shown in Figure 1. The benthic invertebrate checklist includes these sub-basins, as well as 13 smaller areas (lagoons, estuaries, bays). These were added because the number of benthic invertebrate species in shallow coastal waters can be very high compared to open, deeper waters. In order to increase the quality of the information provided in the checklist such areas were identified and made into sub-sections to better show species distribution (see Figure 10).

3.5 Data sources

The checklist by Zettler (2011) was used as a basis for the benthic invertebrates' checklist.

The data sources include 77 publications concerning Finnish waters and a range of databases. For example:

- Database of the Leibniz Institute for Baltic Sea Research Warnemünde, IOW, Germany
- Danish national database for marine data (MADS)
- Benthic invertebrate database of the Finnish Environment Institute
- Benthic invertebrate sampling data of Helsinki City, Finland
- Database of the Estonian Marine Institute, University of Tartu
- Benthic invertebrate data from the Swedish Oceanographic Data Centre
- Benthic invertebrate data from the International Council for the Exploration of the Sea (ICES)
- The Swedish Species Gateway
- The Swedish Red List Database.

Figure 10. Coastal sub-sections additional to the sub-basins used for the benthic invertebrate checklist.

3.6 Checklist

The checklist for Baltic Sea benthic invertebrate species is presented in Chapter 7, Table 7.2 and Table 7.3. This table gives the higher taxonomic group, the valid scientific name (with authors and year), synonyms/ variations or subspecies, taxon ID codes from several databases (Aphia-ID = WoRMS Code, TSN = ITIS Code, BioLib = Biological Library, BioSystematic Database of World Diptera (BDWD), Fauna Europea, Zipcodezoo and other sources) and the distribution data by sub-basin. More specific information such as phylum group etc. can be found in the Excel table provided on the HELCOM website.

4. Checklist documentation and distribution data for Baltic Sea fish and lamprey species

The checklist for Baltic Sea fish and lamprey species compiled within the HELCOM Red List project currently includes 239 species and their most common synonyms. Species diversity per Baltic Sea sub-basin is shown in Figure 11.

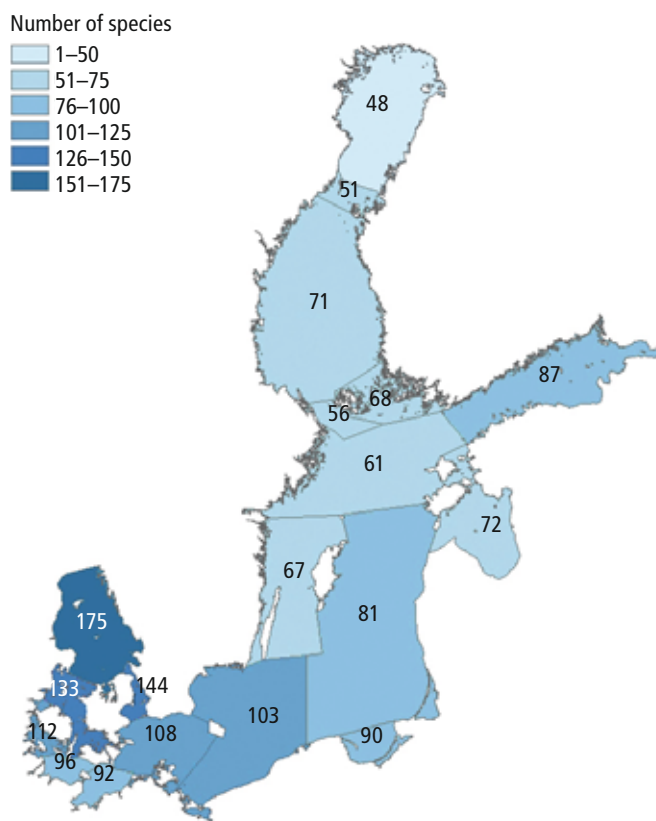

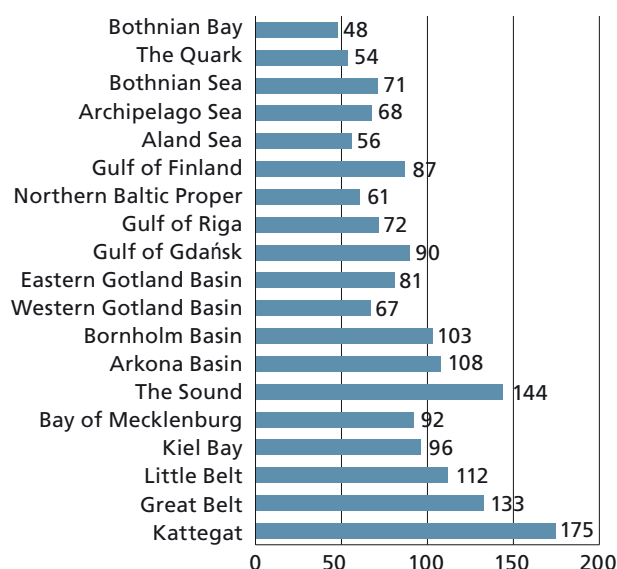

Figure 11. Number of fish and lamprey species per Baltic Sea sub-basin.

4.1 Expert team

Chair: Ann-Britt Florin (Sweden)

Janis Birzaks (Latvia), Dieter Boedeker (Germany), Uwe Böttcher (Germany), Henrik Carl (Denmark), Natalia Chernova (Russia) Christian von Dorrien (Germany), Ronald Fricke (Germany), Linas Lozys (Lithuania), Timo Moritz (Germany), Peter R. Møller (Denmark), Daniel Oesterwind (Germany), Christian Pusch (Germany), Krzysztof Skóra (Poland), Henrik Svedäng (Sweden), Mikael Svensson (Sweden), Lauri Urho (Finland), Francesca Vitale (Sweden).

4.2 Taxonomy

The expert group has followed the Taxonomy of the Catalogue of Fishes (Eschmeyer & Fricke, 2011) which has led to some changes in species names compared to the original list. Only consensual recognised species are included. Hence spring spawning herring *Clupea harengus membras* and marine smelt *Osmerus eperlanomarinus* have been removed and only herring *Clupea harengus* and smelt *Osmerus eperlanus* are included. For the same reason all Baltic coregonous, except *Coregonus albula*, are treated collectively as *Coregonus mareana* s.l.

The vernacular names follow the recommendations of the Journal of Fish Biology using Wheeler (1992) and Wheeler et al. (2004). Some species are missing in the Wheeler (1992) and Wheeler et al. (2004) papers. In most cases it is suggested that those species are named accordingly to FishBase. The exceptions are:

- *Acipenser oxyrinchus* is called American Atlantic sturgeon since *A. sturio* is called Atlantic sturgeon
- *Huso huso* is called Beluga sturgeon instead of Beluga following the general addition of sturgeon to the name in British English
- *Ballerus ballerus* is called Blue breem instead of the less frequently used Zope
- *Pelecus cultratus* is called Razor-fish instead of the more continental name Sichel
- *Salvelinus namaycush* is called Lake charr to show affiliation with *Salvelinus* instead of Lake trout

- *Gasterosteus gymnaurus* lacks a name in FishBase and is called Western three-spined stickleback following iucnredlist.org
- *Trigloporus quadricornis* is called four-horned sculpin instead of four-horn sculpin
- *Lycodes gracilis* is called Checker eelpout instead of Vahl's eelpout, a species from which it is recently split.

Fourteen species have been removed from the checklist because they are only present outside the HELCOM area.

Thirteen species have been removed from the list as no verifiable records from the HELCOM area could be found for these species. A justification for every species is given in Table 3.

4.3 Defining parameters

All hagfish, lampreys and fish recorded within the HELCOM area (with a salinity of least 0.5) since 1800 have been included in the regional checklist. Generalised distribution maps have not been used.

4.4 Distribution

The distribution of fish and lamprey species has been divided by Baltic Sea sub-basin and it is also noted whether the species occurs and shows regular reproduction, regular occurrence but no reproduction, temporary occurrence, and whether occurrence is unknown as opposed to the species not occurring in the area. The distribution in inner Danish waters is not complete owing to a lack of Danish expert resources.

4.5 Data sources

The checklist established in 2007 in the HELCOM Red List of Threatened and Declining Species of Lampreys and Fishes in the Baltic Sea Project (HELCOM 2007) was used as the basis of the present checklist. Denmark and Sweden have made considerable efforts to update and revise their national checklists over the past five years, thereby adding a substantial amount of information about fish fauna in the Kattegat. In addition information from national experts, including national checklists, museum collection registers, and different fish monitoring programmes, were used to modify the list.

Around 50 species have been added to the checklist since HELCOM (2007). Some are introduced and some are due to the arrival of non-indigenous species, but most of the newly added species are due to greater knowledge about the Kattegat and belt Sea.

4.6 Checklist

The checklist for Baltic Sea fish and lamprey species is presented in Chapter 7, Table 7.4. This table gives the higher taxonomic group, the valid scientific name (with authors and year), synonyms/ variations or subspecies, vernacular name, life history (marine, freshwater, anadromous, catadromous), whether it is introduced and distribution by sub-basin.

Table 3. Species removed from the HELCOM checklist of fish and lamprey species and the justification.

Taxon (Catalog of Fishes)	Vernacular name (FishBase)	Justification
<i>Hexanchus griseus</i>	Bluntnose sixgill shark	According to HELCOM 2007 also found in Kattegat but according to Swedish records it was found only once in Sweden in Skagerrak, off Måseskär 10 September 1998 and there are no data from Denmark at this point.
<i>Cottus koshewnikowi</i>	Spiny bullhead	Only found in freshwater (T. Kontula pers comm.)
<i>Raja montagui</i>	Spotted ray	According to HELCOM 2007 east of Kattegat (Stehmann & Bürkel in Whitehead et al. 1984) but no records of the species in Denmark and caught only once in Sweden in Skagerrak and in Whitehead et al 1984 it is unclear from the map if it is in Skagerrak or Kattegat although text says Baltic Sea.
<i>Ciliata septentrionalis</i>	Northern rockling	According to HELCOM 2007 also in Kattegat but only observed three times in Swedish part of Skagerrak and not caught in Danish waters at all.
<i>Lophius budegassa</i>	Black-bellied angler	No Swedish records and never caught in Danish saltwater.
<i>Micrenophrys lilljeborgii</i>	Norway bullhead	According to HELCOM 2007 also in Kattegat and Öresund (Nielsen & Møller 2004) but not present in the updated national checklist and in Sweden latest documented 1923 in Gullmaren & Kosterfjord (Skagerrak)
<i>Pterycombus brama</i>	Atlantic fanfish	According to HELCOM 2007 also in Kattegat but according to Swedish records only in Skagerrak and never for certain caught in Danish saltwater.
<i>Taractes asper</i>	Rough pomfret	According to HELCOM 2007 also found in Kattegat but in Danish and Swedish records no findings have been reported and according to the map in Whitehead et al. 1986 species only occurs in Skagerrak and not in Kattegat or Baltic Sea.
<i>Taractichthys longipinnis</i>	Big-scale pomfret	No Swedish record; Never caught in Danish saltwater
<i>Coregonus pallasii</i>	Pallas's houting	Treated collectively as <i>Coregonus mareana</i> s.l.
<i>Coregonus balticus</i>	Baltic houting	Treated collectively as <i>Coregonus mareana</i> s.l.
<i>Romanogobio albipinnatus</i>	Whitefinned gudgeon	No known occurrences in the HELCOM area, NE in Helcom 2007
<i>Gymnamodytes semisquamatus</i>	Smooth sand-eel	According to HELCOM 2007 in Denmark based on Whitehead et al., 1986 but according to Danish records never caught with certainty in Danish saltwater and no records in Sweden. In Whitehead et al 1986 it says whole North Sea coast but not in the Baltic, the map shows both Kattegat & Belt Sea but questionable how accurate the map is.
<i>Buenia jeffreysi</i>	Jeffrey's goby	According to HELCOM 2007 occurs also in Kattegat but the species have never registered in Danish waters and in Sweden only caught for sure once in Kosterrännan 1927 in Skagerrak.
<i>Acipenser sturio</i>	Sturgeon	Included in oxyrhincus since the sturgeon occurring in the Baltic after 1800 most probably was not sturio (Gessner & Ritterhoff 2004, Bfn-skripten 101)
<i>Clupea harengus membras</i>	Spring spawning herring	Merged with with <i>Clupea haerengus</i>
<i>Osmerus eperlanomarinus</i>	Marine smelt	Merged with <i>Osmerus eperlanus</i>

5. Checklist documentation and distribution data for Baltic Sea breeding bird species

The waterbird expert team focussed first on birds breeding in Baltic Sea marine or coastal areas. This resulted in 56 species being included in the checklist for Baltic breeding birds. For one species – the lesser black-backed gull – there are two subspecies in the Baltic Sea area (*Larus fuscus fuscus* and *L. f. intermedius*), which have been recorded separately. Thus, 57 taxa occur on the checklist. The number of species found breeding in each area can be found in Figure 12.

Figure 12. Number of Baltic Sea breeding bird species per Baltic Sea sub-basin.

5.1 Expert team

Chair: Christof Herrmann (Germany)

Vladimir Fedorov (Russia), Martti Hario (Finland), Jan Kieckbusch (Germany), Markku Mikkola-Roos (Finland), Lidia Sternik (Poland), Antra Stipniece (Latvia), Ole Thorup (Denmark), Martin Tjernberg (Sweden).

5.2 Taxonomy

The bird taxonomy follows the World Register of Marine Species (WoRMS, www.marinespecies.org November 2011).

5.3 Defining parameters

The checklist includes all species breeding in the Baltic Sea area (Figure 12) with a distinct relationship to the marine or coastal environment. Species included in the checklist were required to fulfil the following criteria:

- 'True' marine or coastal bird species, i.e. species which breed exclusively at the coast or only exceptionally inland (e.g. sandwich tern *Sterna sandvicensis*, turnstone *Arenaria interpres*, eider *Somateria mollissima*).
- Species which breed mainly at the coast, or reach higher densities, or form larger colonies at the coast compared to inland (e.g., cormorant *Phalacrocorax carbo sinensis*, white-tailed eagle *Haliaeetus albicilla*).
- Species which are characteristic inhabitants of typical coastal habitats such as coastal bays, salt meadows, dunes, skerries (e.g., lapwing *Vanelus vanellus*, meadow pipit *Anthus pratensis*, northern shoveler *Anas clypeata*, osprey *Pandion haliaetus*).

Species for which 'b' or 'c' is true only for some Baltic regions, are included in the checklist.

Different subspecies are treated separately. This applies to the two subspecies of the lesser black-backed gull breeding in the Baltic Sea area (*Larus fuscus fuscus* and *L. f. intermedius*), but also to the dunlin (*Calidris alpina alpina* and *C. a. schinzii*) and ringed plover (*Charadrius hiaticula hiaticula* and *Ch. h. tundrae*). In the latter cases, only the subspecies *Calidris alpina schinzii* and *Charadrius hiaticula hiaticula*, respectively, have been included, since the other two subspecies do not breed on the Baltic Sea coast.

5.4 Distribution

The reference area for the Baltic Sea breeding bird checklist is the entire territory of the Baltic Sea riparian states (Figure 13). However, for Denmark and Germany / Schleswig-Holstein the coastal zone of the North Sea has been excluded. In the case of Germany, only the Baltic Federal states Schleswig-Holstein and Mecklenburg-Western Pomerania have been considered, and for Russia only the St Petersburg and Kaliningrad regions.

Figure 13. The reference area for the Baltic Sea breeding bird checklist.

The border towards the North Sea is represented by the border of the Helsinki Convention area, that is, between the Kattegat and Skagerrak.

The reasons for not including the entire national (or, in case of Germany and Russia, regional) territories in the checklist are as follows:

- Population monitoring data are usually available on a national or regional level; in most cases it is difficult or even impossible to separate 'coastal' from 'inland' numbers of breeding birds.
- Coastal and inland breeders usually form a single population, that is, there is no (genetic) separation.
- A distinction between 'coastal' and 'inland' breeders for most species would not change the results of the assessment (despite the fact that population trends may differ between coastal and inland areas).

5.5 Data sources

Once criteria for the selection of bird species had been agreed, a preliminary checklist was drawn up by a small group of experts at the HELCOM Red List kick-off meeting in Bonn, October 2009. The preliminary checklist was then circulated among expert team members and revised in accordance with their comments.

5.6 Checklist

The checklist for Baltic Sea breeding bird species is presented in Chapter 7, Table 7.5. This gives the higher taxonomic group, the valid scientific name (with authors and year), synonyms/ variations or subspecies and distribution data by area.

6. Checklist documentation and distribution data for Baltic Sea marine mammal species

The number of marine mammal species in the Baltic Sea is low. In total the checklist contains five species: three seals (*Halichoerus grypus*, *Phoca vitulina vitulina* and *Pusa hispida*), one cetacean (*Phocoena phocoena*) and the otter (*Lutra lutra*). The number of species found in each sub-basin and their distribution can be found in Figure 14

6.1 Expert team

Chair: Olle Karlsson (Sweden)

Johanna Arrendal (Sweden), Anders Galatius (Denmark), Tero Härkönen (Sweden), Ivar Jüssi (Estonia).

6.2 Taxonomy

The taxonomy for marine mammal species follows the World Register of Marine Species (WoRMS www.marinespecies.org).

6.3 Defining parameters

The distribution data are presented by sub-basin and the aim was to include species that occur regularly in these areas. Marine mammal species that occasionally enter the Baltic Sea are not included.

The intention has been to include all aquatic or semi-aquatic species that occur regularly in the Baltic Sea marine or coastal areas.

6.4 Distribution

The checklist includes presence/absence data for the Baltic Sea sub-basins. Marine mammals are highly mobile but their presence is limited to areas where a species is sighted on a regular basis.

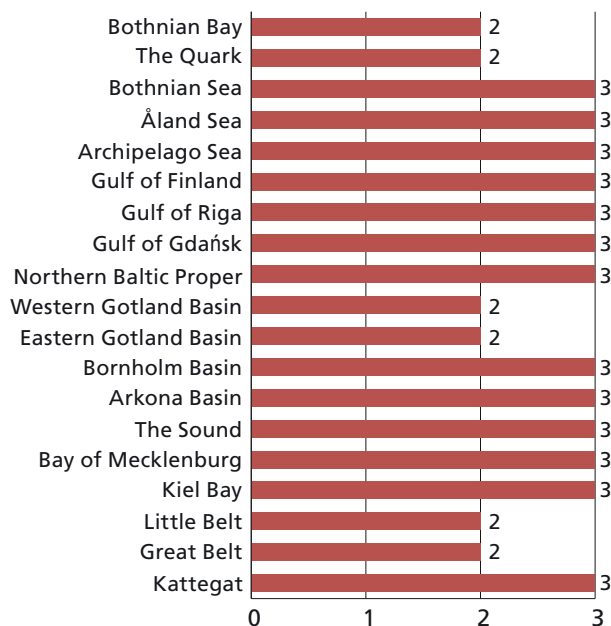

Figure 14. Number of marine mammal species per Baltic Sea sub-basin.

6.5 Data sources

The data used to compile the marine mammal checklist come from national monitoring programmes and have been discussed within the HELCOM Seal Expert Group. Data were also collected in collaboration with experts from outside the Seal group.

6.6 Checklist

The checklist for Baltic Sea marine mammal species is presented in Chapter 7, Table 7.6. This gives the higher taxonomic group, the valid scientific name (with authors and year), synonyms/ variations or subspecies, taxon ID codes (Aphia-ID = WoRMS Code), vernacular name and distribution data by sub-basin.

144	Maxillopoda	Arguloidea	Argulidae	<i>Argulus foliaceus</i>	(Linnaeus, 1758)	234067	-							F	
145	Arachnida	Araneae	Cybaeidae	<i>Argyroneta aquatica</i>	(Clerck, 1757)	-	-	550		348688				F	
146	Polychaeta	Orbiniida	Paraonidae	<i>Aricidea (Acmira) catherinae</i>	Laubier, 1967	333034	66765								
147	Polychaeta	Orbiniida	Paraonidae	<i>Aricidea (Acmira) cerrutii</i>	Laubier, 1967	525497	204494								Aricidea jeffreysii Eliason, 1962 partim; Aricidea cerrutii Laubier, 1966
148	Polychaeta	Orbiniida	Paraonidae	<i>Aricidea minuta</i>	Southward, 1956	130564	66682								Aricidea (Aricidea) minuta Southward, 1956
149	Polychaeta	Orbiniida	Paraonidae	<i>Aricidea suecica</i>	Eliason, 1920	130572	66667								Aricidea jeffreysii Eliason, 1962 partim; Aricidea (Allia) suecica Eliason, 1920
150	Gastropoda	Basommatophora	Planorbidae	<i>Armiger crista</i>	(Linnaeus, 1758)	-	76619							F	Gyraulus crista (Linnaeus, 1758)
151	Gastropoda	Nudibranchia	Arminidae	<i>Armina loveni</i>	(Bergh, 1860)	138804	78571								
152	Malacostraca	Amphipoda	Oedicerotidae	<i>Arrhis phyllonx</i>	(Sars, 1858)	102870	94501								Aceros phyllonx (Sars, 1858); Leucothoe phyllonx Sars, 1858;
153	Polychaeta	Terebellida	Terebellidae	<i>Artacama proboscidea</i>	Malmgren, 1866	131482	67987								
154	Ascidacea	Enterogona	Asciidae	<i>Ascidia conchilega</i>	Moeller, 1842	103702	159188								
155	Ascidacea	Enterogona	Asciidae	<i>Ascidia mentula</i>	Müller, 1776	103710	159187								
156	Ascidacea	Enterogona	Asciidae	<i>Ascidia obliqua</i>	Alder, 1863	103713	159177								
157	Ascidacea	Enterogona	Asciidae	<i>Ascidia virginea</i>	Müller, 1776	103717	159189								
158	Ascidacea	Enterogona	Asciidae	<i>Asciella aspersa</i>	Müller, 1776	103718	159213								
159	Ascidacea	Enterogona	Asciidae	<i>Asciella scabra</i>	Müller, 1776	103719	159214								
160	Malacostraca	Isopoda	Asellidae	<i>Asellus (Asellus) aquaticus</i>	(Linnaeus, 1758)	264152	92662							F	
161	Malacostraca	Isopoda	Arcturidae	<i>Astacilla dilatata</i>	Sars, 1882	295579	-								Arcturella dilatata (Sars, 1882)
162	Malacostraca	Isopoda	Arcturidae	<i>Astacilla intermedia</i>	(Goodsir, 1841)	119023	206336								Astacilla affinis (Sars, 1869)
163	Malacostraca	Isopoda	Arcturidae	<i>Astacilla longicornis</i>	(Sowerby, 1806)	119024	92551								
164	Bivalvia	Veneroida	Astartidae	<i>Astarte borealis</i>	(Schumacher, 1817)	138818	80831								Astarte falsteri Hopner Petersen, 2001; Tridonta borealis Schumacher, 1817
165	Bivalvia	Veneroida	Astartidae	<i>Astarte elliptica</i>	(Brown, 1827)	138821	80812								Tridonta elliptica (Pennant, 1777); Astarte (Tridonata) elliptica (Brown, 1827); Astarte sulcata (da Costa, 1778) partim
166	Bivalvia	Veneroida	Astartidae	<i>Astarte montagui</i>	(Dillwyn, 1817)	138823	80837								Tridonta montagui (Dillwyn, 1817); Nicania montagui (Dillwyn, 1817)
167	Bivalvia	Veneroida	Astartidae	<i>Astarte sulcata</i>	(da Costa, 1778)	138824	80815								
168	Asteroidea	Forcipulatida	Asteriidae	<i>Asterias rubens</i>	Linnaeus, 1758	123776	157220								
169	Asteroidea	Paxillosida	Astropectinidae	<i>Astropecten irregularis</i>	(Pennant, 1777)	123867	156909								
170	Polychaeta	Capitellida	Maldanidae	<i>Asychis biceps</i>	(M. Sars, 1861)	146523	67522								Asychis jeffreysii McIntosh, 1915; Chirimia biceps (Sars, 1861); Clymene biceps Sars, 1861; Maldane consobrina Marion, 1876;
171	Malacostraca	Decapoda	Atelecyclidae	<i>Atelecyclus rotundatus</i>	(Olivi, 1792)	107273	98667								
172	Malacostraca	Decapoda	Alpheidae	<i>Athanas nitescens</i>	(Leach, 1814)	107486	96720								
173	Insecta	Trichoptera	Leptoceridae	<i>Athripsodes cinereus</i>	(Curtis, 1834)	-	602640							F	
174	Malacostraca	Decapoda	Pandalidae	<i>Atlantopandalus propinquus</i>	(Sars, 1870)	158351	621752								
175	Malacostraca	Amphipoda	Atylidae	<i>Atylus swammerdami</i>	(Milne-Edwards, 1830)	102131	93523								Nototropis swammerdami (Milne-Edwards, 1830);
176	Malacostraca	Amphipoda	Atylidae	<i>Atylus vedlomensis</i>	(Bate & Westwood, 1862)	102132	206422								Nototropis vedlomensis (Bate & Westwood, 1862);
177	Clitellata	Haplotaxida	Tubificidae	<i>Aulodrilus japonicus</i>	Jamaguchi, 1953	-	-	443661		234529				F	
178	Clitellata	Haplotaxida	Tubificidae	<i>Aulodrilus limnobius</i>	Bretscher, 1899	-	68682							F	
179	Clitellata	Haplotaxida	Tubificidae	<i>Aulodrilus pigueti</i>	Kowalewski, 1914	-	68680							F	
180	Malacostraca	Amphipoda	Aoridae	<i>Autonoe longipes</i>	(Liljeborg, 1852)	102021	-								Lembos longipes (Liljeborg, 1852)
181	Demospongiae	Halichondrida	Axinellidae	<i>Axinella infundibuliformis</i>	(Linnaeus, 1759)	132480	204023								
182	Demospongiae	Halichondrida	Axinellidae	<i>Axinella rugosa</i>	(Bowerbank, 1866)	132491	48334

46	<i>Rissa tridactyla</i>	X	-	-	-	-	-	-	-	-	-	0(X)	(Linnaeus, 1758)	137156	Black-legged kittiwake
47	<i>Somateria mollissima</i>	X	X	X	-	X	-	-	(0)	X	X	X	(Linnaeus, 1758)	137074	Common eider
48	<i>Stercorarius parasiticus</i>	X	X	-	-	-	-	-	-	-	-	-	(Linnaeus, 1758)	137172	Parasitic jaeger
49	<i>Sterna hirundo</i>	X	X	X	X	X	X	X	X	X	X	X	(Linnaeus, 1758)	137162	Common tern
50	<i>Sterna paradisaea</i>	X	X	X	-	X	X	-	0	X	X	X	(Pontoppidan, 1763)	137165	Arctic tern
51	<i>Sterna sandvicensis</i>	X	-	-	-	X	-	-	X	X	0(X)	X	(Latham, 1787)	137166	Sandwich tern
52	<i>Sternula albifrons</i>	X	X	X	X	X	X	X	X	X	X	X	(Pallas, 1764)	567480	Little tern
53	<i>Tadorna tadorna</i>	X	X	X	X	X	X	X	X	X	X	X	(Linnaeus, 1758)	232042	Common shelduck
54	<i>Tringa totanus</i>	X	X	X	X	X	X	X	X	X	X	X	(Linnaeus, 1758)	158970	Redshank
55	<i>Uria aalge</i>	X	X	(X)[4]	-	-	-	-	-	-	-	X	(Pontoppidan, 1763)	137133	Common guillemot; Common murre
56	<i>Vanellus vanellus</i>	X	X	X	X	X	X	X	X	X	X	X	(Linnaeus, 1758)	159142	Lapwing
57	<i>Xenus cinereus</i>	-	X	X	-	-	X	-	-	-	-	-	(Latham, 1790)	212602	Terek sandpiper

[4] First breeding in 2010, Vysotsky et al. 2010.

x = breeding, (x) = sporadic breeding (only occasional breeding records), 0 = extinct (breeding in the past, but no actual breeding records), (0) = sporadic breeder in the past, no breeding records during the last 3 generations or 10 years, 0(X) = extinct as a regular breeder, but sporadic breeding records during the last 3 generations or 10 years, - = no breeding birds

7.6 Checklist for Baltic Sea marine mammal species

HELCOM Checklist for Baltic Sea Marine Mammals																									
No	Family	Valid Taxon Name	Distribution																	Authors/year	Synonyms	Alpha ID (WoRMS)	Vernacular name/s		
			A	B	C	D	E	F	G	H	I	J	K	L	M	N	O	P	Q					R	S
			Kattegatt	Great Belt	Little Belt	Kiel Bay	The Bay of Mecklenburg	The Sound	Arkona Basin	Bornholm Basin	The Eastern Gotland Basin	The Western Gotland Basin	The Northern Baltic Proper	The Gulf of Gdańsk	Gulf of Riga	Gulf of Finland	Archipelago Sea	Åland Sea	The Bothnian Sea	The Quark	Bothnian Bay				
1	Phocidae	<i>Halichoerus grypus</i>	x			x	x	x	x	x	x	x	x	x	x	x	x	x	x	x		(Fabricius, 1791)		137080	grey seal / gray seal
2	Phocidae	<i>Phoca vitulina vitulina</i>	x	x	x	x	x	x	x	x				x								(Linnaeus, 1758)		255033	harbour seal / common seal
3	Phocidae	<i>Pusa hispida</i>												x	x	x	x	x	x	x	x	(Schreber, 1775)	<i>Phoca hispida</i> (Schreber, 1775)	159021	ringed seal
4	Phocoenidae	<i>Phocoenidae Phocoenidae</i>	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x			(Linnaeus, 1758)		137117	harbour porpoise
5	Mustelidae	<i>Lutra lutra</i>																				(Linnaeus, 1758)		137076	European otter
