#### Introduction

This document presents the top litter items identified for the Baltic Sea region as a whole as well as at a sub-basin level. The lists are prepared based on data available as provided by countries. Top litter items are calculated using the rank method.

# Available data

Monitoring of beach litter in the Baltic Sea area is carried out in Denmark, Estonia, Finland, Germany, Latvia, Lithuania, Poland and Sweden. In six countries monitoring started in 2012, in five of them data were collected in the period 2012-2016. In Denmark and Poland monitoring started in 2015 (see Table 1 and Figure 1). Further detailed information on the beaches considered in the report is included in Annex 1.

Country	Monitoring period	Number of monitoring sections	Length of monitored section	Beach types (number)	Frequency of monitoring per year	Seasons (total number of visits)	Marine litter items categorization
Denmark	2015 - 2016	3	100	reference (rural) (3)	3(4)	spring (6), summer (6), autumn (6), winter (1)	TG ML Master list
Estonia	2012 - 2016	10	300, 350, 400, 500, 600, 800, 2500, 3000	peri-urban (5), urban (1), rural (4)	3	spring (32), summer (42), autumn (32)	MARLIN/UNEP/ IOC
Finland	2012 - 2016	12	100, 110, 152, 320, 326	peri-urban (3), urban (5), rural (4)	3	spring (45), summer (42), autumn (42)	MARLIN/UNEP

Sweden	2012 - 2016	10	100	peri-urban(6), rural (4)	3	spring (37), summer (37), autumn (39)	MARLIN/ UNEP

Table 1. Summary of available national beach litter monitoring data: spatial, temporal and categorization method used.

The number of monitored beaches (stations) varies by country. The smallest number of beaches is monitored in Denmark (3) and Lithuania (4), while the largest number of monitored beaches is in Latvia (42). The main types of monitored beaches are urban and rural ones, but in some countries reference beaches (where the anthropogenic impact is minimal) as well as peri-urban beaches are monitored. The length of the monitored beaches ranges from 100 to 3000m, being 100m the most common length used (in five countries). In four countries, monitoring is conducted three times a year (spring, summer and autumn). In the case of Denmark, only one survey was conducted in winter time. In Germany and Poland regular monitoring is conducted in the four seasons of the year. In Latvia, monitoring is carried out only in the summer season.

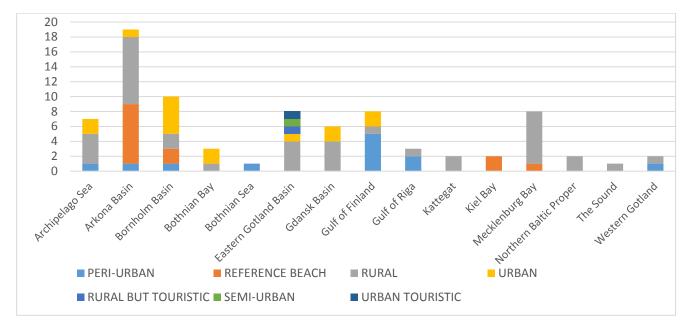

Figure 1. Beaches included in the report by sub-basin.

The monitored litter is assigned to eight main material categories: artificial polymer materials, rubber, cloth/textile, paper/cardboard, processed/worked wood, metal, glass/ceramics and unclassified. Some countries have identified two additional categories: food waste and chemicals such as e.g. paraffin, wax, oil or tar. The categorization of individual litter items is conducted according to different methodologies and protocols (UNEP 2009, OSPAR 2010, JRC 2013, MARLIN 2013) depending on the countries. Task Group Master List (TG ML) (JRC 2013) is used in Denmark and Poland, the MARLIN / UNEP classification methodology is used in four countries: Estonia, Finland, Latvia and Sweden, whereas Germany use the OSPAR methodology and protocol.

# Method used to calculate top litter items lists: the rank method

The rank method is based on total amounts of pieces of litter. Items are not counted per meters nor square meters, but only in total amounts of pieces. All beaches, all seasons and all monitored years are included. These vary by country. The use of the rank method gives the opportunity to study which the most commonly found items on the beaches are.

Top litter item lists are obtained based on data provided by countries (see Table 1). Data has been provided by Denmark, Estonia, Finland, Germany, Latvia, Lithuania, Poland and Sweden. Data provided by Latvia was not used due to its lack of representativity (Latvia conducts only one assessment per year, per beach).

To achieve the goal of having one regional top litter item list, some grouping/harmonization of litter item categories among coding lists was required at the end of the analysis process. The grouping/harmonization is presented in Table 2, where the word in capital letters refers to the type of material the litter item is made of (see Table 3). For further identification of the categories include under each harmonized category see Annex 2-4.

# Regional top litter items

The regional top litter item –list (Table 4) is conducted using the ranking method as advised by the HELCOM EN-Marine Litter (memo of the on-line meeting held on 11 October 2017). All data provided by countries, excluding Latvia, is used in the analysis. Each beach litter survey was analyzed, giving each survey its own individual top litter item list.

For each survey a separate top 20 list was ranked with the following method: the most common litter item (highest in number) received a rank value of 20, the second most common litter item received the rank value of 19, and so on until reaching rank value 1. Ties were given the same rank value, e.g. 20, 20, 20, 19, 18, 18, 17, 16, 15, 15, ...1.

After ranking of each survey, all rank values were counted together giving each litter category a rank sum. Subsequently, the rank sums were ordered, where the item receiving the highest rank sum is the most common litter item. This was done separately for each methodology (UNEP, OSPAR, TG ML) and separately for each beach type (rural, urban and peri-urban). These individual lists were in the end pulled together by harmonizing categories according to Table 2.

The percentage of litter items surveyed is around 20% less in rural beaches compared to urban and periurban beaches (see Table 4). The Baltic Sea regional top 20 litter items by type of beach are shown in Table 5 and Figure 2. It is noticeable that many of the items found are related to eating, drinking or smoking activities. Plastic pieces of different sizes can also be found on all beach types, being the most commonly found litter item at rural and at peri-urban beaches, and the second one at urban beaches.

Type of beach	Total amount of litter items	% of all litter at beaches
RURAL	54421	60,72
URBAN	55622	79,19
PERI-URBAN	14439	78,05

Table 5. Baltic Sea regional top 20 litter items by type of beach.

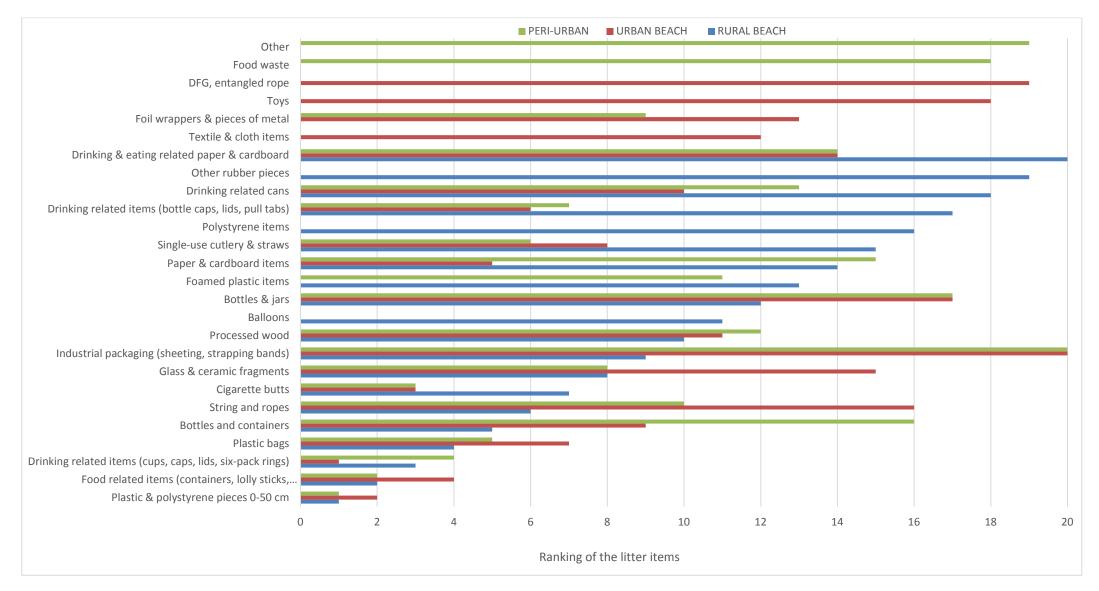

Figure 2. Visualisation of the Baltic Sea regional top 20 litter items by type of beach.

It is to point out that there are 26 different litter items categories found on the three different types of beaches considered, of which 15 appear in the three top litter items lists.

# Sub-basin top litter items lists

The same ranking method was used to calculate the sub-basin top litter items (see Table 7). The percentage of how much the top litter item—list counts of the total litter items varies from 65 to 100 %, being the average percentage 85,99% (see Table 6).

Table 7. Top litter items according to Baltic Sea sub-basins.

As in the case of the results found at regional level, also at sub-basin level many of the items are related to eating, drinking and smoking activities – these items can be found at each sub-basin top litter item list. The total rank of these items, which relates to eating, drinking and smoking varies slightly depending on the sub-basin. In Table 7 some litter items have not been harmonized (highlighted in yellow), as the item does not fit into the harmonized category (see Table 2) and were singular cases. Pieces of plastic of different size can be found at all sub-basin top litter item -lists, at many being the most common litter item. Plastic bags are also found at all sub-basin top litter item –lists (see also Table 8).

Table 8. Compilation of top litter 20 items

An interesting single item that can be found at 60% of sub-basin top litter item -lists are balloons and balloon related items that are to be attached to the balloon. Industrial packaging related items such as sheeting, strapping bands and masking tape can be found at 73% of all sub-basins. Derelict fishing gear can be found within the Eastern Gotland Bay, Gdansk Bay and Kiel Bay top litter item -lists.

#### Discussion

The results found indicate that many of the litter items come from eating, drinking and smoking related activities. Many of these activities are conducted while moving from one place to another (take away – lifestyle) or when spending spare time close by the sea or river.

The commonness of these eating, drinking and smoking related items may suggest that these items are abandoned on the environment as such, or they are not properly handled being drifted by wind, waterways, rain or animals further from trash collection.

The commonness of plastic litter and especially the commonness of plastic pieces and plastic packacing, suggests that the use of plastic in different items is usual. Worldwide production of plastics in 2015 was 322 million tonnes Approximately 40 % of the plastic produced is used in packacing (Plastics Europe, 2016). Plastic degrades slowly, ultraviolet radiation and mechanical wear and tear speeds the process, but the speed varies much. Plastic partially degrades to microlitter, but never degrades completely.

Many of the actions that could contribute to the reduction of the litter present on the beaches in the Baltic Sea are already included in the HELCOM Regional Action Plan for Marine Litter (RAP ML). Below are described suggestions for further action deriving from this report, linked to specific actions in the <u>RAP ML</u>.

Trash collection systems are needed in all areas in which people move around or spend time, including the most rural areas into which people are guided to, such as national parks. It is encouraged that in these wide trash collection systems, recycling is taken into account making it possible to recycle most of the litter and by doing that also supporting circular economy efforts. Actions RL1, RL2, RL3, RL4 and RL5 in the action plan are in line with this suggestion, therefore their implementation is encouraged.

Educational efforts and campaigns against marine littering are a vital part of tackling the problem. The educational efforts and campaings should be aimed at a wide variety of age groups from the general public. It is also suggested that these campaigns are spread to more deeper and wider areas than just coastal areas, especially to areas which are located by rivers and lakes, as rivers act as litter pathways. Some of these needs are addressed in actions RE1, RE2 and RE3 of the action plan, as well as voluntary national acions N1-N4.

As the results show that much of the litter comes from eating, drinking and smoking related activities it is suggested to identify the options to address these key waste items, including deposit schemes and extended producer responsibility. This would be in line with action RL11 of the Action Plan.

As balloons as a single item occur at 60% of sub-basin top litter item lists, it is suggested to conduct actions aiming at preventing the release of balloons on land and on the sea. To support this it is encouraged to conduct a case study on how common the release of balloons is at cruise ships in the Baltic Sea, especially from those ships just visiting the Baltic Sea region.

The presence of plastic bags in all sub-basins of the Baltic Sea points out the need to implement action RL10 of the Action Plan.

Plastic pieces of different size in the marine environment are a major problem. Many of the pieces derive from bigger litter items, such as plastic bags, bottles, food containers, etc. Many may also come from expanded polystyrene (EPS) based items used in different industrial sections (construction, fishing, material

production). It is suggested that much effort is paid to action RL9 in the Action Plan, to tackle the issue of plastic pieces.
