HELCOM	PresEnvAcu PolluEvents (Acute pollution events)	OTH: Other: Other discharges I – estimated size and volume	HEL-034 HELCOM Manual on co-operation in response to marine pollution	QA carried out by national authorities and QC performed for datasets before publishing.	Continually			EEZ	1998 (SE: 1976)	All Baltic Sea coastal states have agreed to parcipate in the collaboration to the best of their ability

² Needed codelists can be found on 2020 update of Article 11 for the Marine Strategy Framework Directive (MSFD Guidance Document 17, 2020).

³ The option "Different for each country - see MORE overview" refers to the <u>overview</u> carried out in 2013

⁴ Give the name of HELCOM core indicators that are based on the monitoring parameter.

⁵ Provide information on the Contracting Partie(s) that are monitoring the parameter.

PARAMETER

Mineral oil / Other discharges / Input level of chemical/nutrient/pollutant from sea-based sources

METHOD (MonitoringDetails)

Mineral oil / Other discharges / Input level of chemical/nutrient/pollutant from sea-based sources

HELCOM RESPONSE Manual

QA/QC

Mineral oil / Other discharges / Input level of chemical/nutrient/pollutant from sea-based sources

The volume of the spills confirmed/observed as mineral oil is calculated using the Bonn Agreement Oil Appearance Code (BAOAC). The minimum value is reported.

QC is performed for the compiled regional dataset.

FREQUENCY

Frequency

Mineral oil / Other discharges / Input level of chemical/nutrient/pollutant from sea-based sources

According to the HELCOM RESPONSE Manual Volume 1, Chapter 7, all Baltic Sea coastal states should endeavor to fly - as a minimum - twice per week over regular traffic zones including approaches to major sea ports as well as in regions with regular offshore activities. Other regions with sporadic traffic and fishing activies should be covered once per week. In general more flights are conducted during daylight compared to darkness. Coordinated Extended Pollution Control Operation (CEPCO) Flights are arranged yearly where surveillance aircrafts of several countries adjoining the chosen CEPCO Flight routines have to maintain for 24 hours (or even more) a continuous surveillance flying along the prefixed flight patterns. In practice, some countries conduct more aerial surveillance than other countries.

SPATIAL SCOPE

Spatial Scope

Mineral oil / Other discharges / Input level of chemical/nutrient/pollutant from sea-based sources

According to the HELCOM RESPONSE Manual Volume 1, Chapter 7, each

Baltic Sea coastal state operates at least in its own response region during regular national flights. In addition, the States organize and participate in specific joint Coordinated Extended Pollution Control Operation (CEPCO) Flights in the Baltic Sea. Closer cooperation with neighbouring countries, within e.g. sub-regional agreements, is appreciated.

SPATIAL RESOLUTION (DENSITY) OF SAMPLING

Spatial resolution

Mineral oil / Other discharges / Input level of chemical/nutrient/pollutant from sea-based sources

Vertical resolution varies among the sampling stations depending on boom depth: (1) boom to surface, (2) boom to halocline, halocline to thermocline, thermocline to surface, (3) boom to thermocline, thermocline to surface, (4) discrete depth layers (e.g. 100-60 m, 60-30 m, 30-0 m).

Provide considerations for the scale of aggregation of data for an indicator-based assessment Tick one or more relevant boxes below:

☐MSFD Region
□EU
□Other (specify)
□Unknown

c.5 Monitoring and assessment requirements

Monitoring requirements:

Data on accidental and illegal discharges of oil and other substances from sea-based sources is needed to assess the input of contaminants to the sea to be able to follow up the effectiveness of enforcement of international regulations.

Baltic Sea costal states annually report the number of oil discharges observed in the Baltic Sea (Input quantity per area per time).

Adequacy for assessment of GES:

Monitoring should provide adequate data and information to enable the periodic assessment of environmental status, and distance from and progress towards GES as required by MSFD under Article 9 and Article 11.

	riteria (GES Criteria) nost relevant option(s). Tick one or more boxes below.
Descriptor 1	□ D1C1 – Primary:
	The mortality rate per species from incidental by-catch is below levels which threaten the species, such that its long- term viability is ensured.
	Member States shall establish the threshold values for the mortality rate from incidental by-catch per species, through regional or subregional cooperation.
	□ D1C2 – Primary:
	The population abundance of the species is not adversely affected due to anthropogenic pressures, such that its long-term viability is ensured.
	Member States shall establish threshold values for each species through regional or subregional cooperation, taking account of natural variation in population size and the mortality rates derived from D1C1, D8C4 and D10C4 and other relevant pressures. For species covered by Directive 92/43/EEC, these values shall be consistent with the Favourable Reference Population values established by the relevant Member States under Directive 92/43/EEC.
	☐ D1C3 — Primary for commercially- exploited fish and cephalopods and secondary for other species:
	The population demographic characteristics (e.g. body size or age class structure, sex ratio, fecundity, and survival rates) of the species are indicative of a healthy population which is not adversely affected due to anthropogenic pressures.
	Member States shall establish threshold values for specified characteristics of each species through regional or subregional cooperation, taking account of adverse effects on their health derived from D8C2, D8C4 and other relevant pressures.
	☐ D1C4 – Primary for species covered by Annexes II, IV or V to Directive 92/43/EEC and secondary for other species:
	The species distributional range and, where relevant, pattern is in line with prevailing physiographic, geographic and climatic conditions.
	Member States shall establish threshold values for each species through regional or subregional cooperation. For species covered by Directive 92/43/EEC, these shall be consistent with the Favourable Reference Range values established by the relevant Member States under Directive 92/43/EEC.
	☐ D1C5 — Primary for species covered by Annexes II, IV and V to Directive 92/43/EEC and secondary for other species:

	The habitat for the species has the necessary extent and condition to support the different stages in the life history of the species.
	□ D1C6 – Primary
	The condition of the habitat type, including its biotic and abiotic structure and its functions (e.g. its typical species composition and their relative abundance, absence of particularly sensitive or fragile species or species providing a key function, size structure of species), is not adversely affected due to anthropogenic pressures.
	Member States shall establish threshold values for the condition of each habitat type, ensuring compatibility with related values set under Descriptors 2, 5 and 8, through regional or subregional cooperation.
Descriptor 2	□ D2C1 – Primary:
	The number of non-indigenous species which are newly introduced via human activity into the wild, per assessment period (6 years), measured from the reference year as reported for the initial assessment under Article 8(1) of Directive 2008/56/EC, is minimised and where possible reduced to zero.
	Member States shall establish the threshold value for the number of new introductions of non-indigenous species, through regional or subregional cooperation.
	□ D2C2 — Secondary:
	Abundance and spatial distribution of established non-indigenous species, particularly of invasive species, contributing significantly to adverse effects on particular species groups or broad habitat types.
	□ D2C3 — Secondary:
	Proportion of the species group or spatial extent of the broad habitat type which is adversely altered due to non-indigenous species, particularly invasive non-indigenous species.
	Member States shall establish the threshold values for the adverse alteration to species groups and broad habitat types due to non-indigenous species, through regional or subregional cooperation.
Descriptor 3	□ D3C1 — Primary:
	The Fishing mortality rate of populations of commercially-exploited species is at or below levels which can produce the maximum sustainable yield (MSY). Appropriate scientific bodies shall be consulted in accordance with Article 26 of Regulation (EU) No 1380/2013.
	□ D3C2 — Primary:
	The Spawning Stock Biomass of populations of commercially-exploited species are above biomass levels capable of producing maximum sustainable yield. Appropriate scientific bodies shall be consulted in accordance with Article 26 of Regulation (EU) No 1380/2013.
	□ D3C3 — Primary:
	The age and size distribution of individuals in the populations of commercially-exploited species is indicative of a healthy population. This shall include a high proportion of old/large individuals and limited adverse effects of exploitation on genetic diversity.

	Member States shall establish threshold values through regional or subregional cooperation for each population of species in accordance with scientific advice obtained pursuant to Article 26 of Regulation (EU) No 1380/2013.
Descriptor 4	□ D4C1 — Primary:
	The diversity (species composition and their relative abundance) of the trophic guild is not adversely affected due to anthropogenic pressures.
	Member States shall establish threshold values through regional or subregional cooperation.
	☐ D4C2 — Primary:
	The balance of total abundance between the trophic guilds is not adversely affected due to anthropogenic pressures.
	Member States shall establish threshold values through regional or subregional cooperation.
	☐ D4C3 — Secondary:
	The size distribution of individuals across the trophic guild is not adversely affected due to anthropogenic pressures.
	Member States shall establish threshold values through regional or subregional cooperation.
	\square D4C3 — Secondary (to be used in support of criterion D4C2, where necessary):
	Productivity of the trophic guild is not adversely affected due to anthropogenic pressures.
	Member States shall establish threshold values through regional or subregional cooperation.
Descriptor 5	□ D5C1 — Primary:
	Nutrient concentrations are not at levels that indicate adverse eutrophication effects.
	The threshold values are as follows:
	(a) in coastal waters, the values set in accordance with Directive 2000/60/EC;
	(b) beyond coastal waters, values consistent with those for coastal waters under Directive 2000/60/EC. Member States shall establish those values through regional or subregional cooperation
	□ D5C2 — Primary:
	Chlorophyll a concentrations are not at levels that indicate adverse effects of nutrient enrichment.
	The threshold values are as follows:
	(c) in coastal waters, the values set in accordance with Directive 2000/60/EC;
	(d) beyond coastal waters, values consistent with those for coastal waters under Directive 2000/60/EC. Member States shall establish those values through regional or subregional cooperation.
	□ D5C3 — Secondary:

The number, spatial extent and duration of harmful algal bloom events are not at levels that indicate adverse effects of nutrient enrichment.
\square D5C4 — Secondary:
The photic limit (transparency) of the water column is not reduced, due to increases in suspended algae, to a level that indicates adverse effects of nutrient enrichment.
The threshold values are as follows:
(e) in coastal waters, the values set in accordance with Directive 2000/60/EC;
(f) beyond coastal waters, values consistent with those for coastal waters under Directive 2000/60/EC. Member States shall establish those values through regional or subregional cooperation.
\square D5C5 — Primary (may be substituted by D5C8):
The concentration of dissolved oxygen is not reduced, due to nutrient enrichment, to levels that indicate adverse effects on benthic habitats (including on associated biota and mobile species) or other eutrophication effects.
The threshold values are as follows:
(g) in coastal waters, the values set in accordance with Directive 2000/60/EC;
(h) beyond coastal waters, values consistent with those for coastal waters under Directive 2000/60/EC. Member States shall establish those values through regional or subregional cooperation.
☐ D5C6 — Secondary:
The abundance of opportunistic macroalgae is not at levels that indicate adverse effects of nutrient enrichment.
The threshold values are as follows:
(a) in coastal waters, the values set in accordance with Directive 2000/60/EC;
(b) should this criterion be relevant for waters beyond coastal waters, values consistent with those for coastal waters under Directive 2000/60/EC. Member States shall establish those values through regional or subregional cooperation.
\square D5C7 — Secondary:
The species composition and relative abundance or depth distribution of macrophyte communities achieve values that indicate there is no adverse effect due to nutrient enrichment including via a decrease in water transparency, as follows:
(a) in coastal waters, the values set in accordance with Directive 2000/60/EC;
(b) should this criterion be relevant for waters beyond coastal waters, values consistent with those for coastal waters under Directive 2000/60/EC. Member States shall establish those values through regional or subregional cooperation.
\square D5C8 — Secondary: (except when used as a substitute for D5C5):
The species composition and relative abundance of macrofaunal communities, achieve values that indicate that there is no adverse effect due to nutrient and organic enrichment as follows:

	(a) in coastal waters, the values for benthic biological quality elements set in accordance with Directive 2000/60/EC;
	(b) beyond coastal waters, values consistent with those for coastal waters under Directive 2000/60/EC. Member States shall establish those values through regional or subregional cooperation.
Descriptor 6	□ D6C1 – Primary:
	Spatial extent and distribution of physical loss (permanent change) of the natural seabed.
	□ D6C2 – Primary:
	Spatial extent and distribution of physical disturbance pressures on the seabed.
	□ D6C3 – Primary:
	Spatial extent of each habitat type which is adversely affected, through change in its biotic and abiotic structure and its functions (e.g. through changes in species composition and their relative abundance, absence of particularly sensitive or fragile species or species providing a key function, size structure of species), by physical disturbance.
	Member States shall establish threshold values for the adverse effects of physical disturbance, through regional or subregional cooperation.
	☐ D6C4 – Primary:
	The extent of loss of the habitat type, resulting from anthropogenic pressures, does not exceed a specified proportion of the natural extent of the habitat type in the assessment area.
	Member States shall establish the maximum allowable extent of habitat loss as a proportion of the total natural extent of the habitat type, through cooperation at Union level, taking into account regional or subregional specificities.
	□ D6C5 – Primary:
	The extent of adverse effects from anthropogenic pressures on the condition of the habitat type, including alteration to its biotic and abiotic structure and its functions (e.g. its typical species composition and their relative abundance, absence of particularly sensitive or fragile species or species providing a key function, size structure of species), does not exceed a specified proportion of the natural extent of the habitat type in the assessment area.
	Member States shall establish threshold values for adverse effects on the condition of each habitat type, ensuring compatibility with related values set under Descriptors 2, 5, 6, 7 and 8, through cooperation at Union level, taking into account regional or subregional specificities. Member States shall establish the maximum allowable extent of those adverse effects as a proportion of the total natural extent of the habitat type, through cooperation at Union level, taking into account regional or subregional specificities.
Descriptor 7	□ D7C1 – Secondary:
	Spatial extent and distribution of permanent alteration of hydrographical conditions (e.g. changes in wave action, currents, salinity, temperature) to the seabed and water

	column, associated in particular with physical loss(1) of the natural seabed.
	□ D7C2 – Secondary:
	Spatial extent of each benthic habitat type adversely affected (physical and hydrographical characteristics and associated biological communities) due to permanent alteration of hydrographical conditions.
Descriptor 8	□ D8C1 – Primary:
	Within coastal and territorial waters, the concentrations of contaminants do not exceed the following threshold values:
	(a) for contaminants set out under point 1(a) of criteria elements, the values set in accordance with Directive 2000/60/EC;
	(b) when contaminants under point (a) are measured in a matrix for which no value is set under Directive 2000/60/EC, the concentration of those contaminants in that matrix established by Member States through regional or subregional cooperation;
	(c) for additional contaminants selected under point 1(b) of criteria elements, the concentrations for a specified matrix (water, sediment or biota) which may give rise to pollution effects. Member States shall establish these concentrations through regional or subregional cooperation, considering their application within and beyond coastal and territorial waters.
	Beyond territorial waters, the concentrations of contaminants do not exceed the following threshold values:
	(a) for contaminants selected under point 2(a) of criteria elements, the values as applicable within coastal and territorial waters;
	(b) for contaminants selected under point 2(b) of criteria elements, the concentrations for a specified matrix (water, sediment or biota) which may give rise to pollution effects. Member States shall establish these concentrations through regional or subregional cooperation.
	□ D8C2 – Secondary:
	The health of species and the condition of habitats (such as their species composition and relative abundance at locations of chronic pollution) are not adversely affected due to contaminants including cumulative and synergetic effects.
	Member States shall establish those adverse effects and their threshold values through regional or subregional cooperation.
	☑ D8C3 – Primary:
	The spatial extent and duration of significant acute pollution events are minimised.
	☐ D8C4 – Secondary (to be used when a significant acute pollution event has occurred):
	The adverse effects of significant acute pollution events on the health of species and on the condition of habitats (such as their species composition and relative abundance) are minimised and, where possible, eliminated.
Descriptor 9	□ D9C1 – Primary:
	The level of contaminants in edible tissues (muscle, liver, roe, flesh or other soft parts,

	as appropriate) of seafood (including fish, crustaceans, molluscs, echinoderms, seaweed and other marine plants) caught or harvested in the wild (excluding fin-fish from mariculture) does not exceed:
	(a) for contaminants listed in Regulation (EC) No 1881/2006, the maximum levels laid down in that Regulation, which are the threshold values for the purposes of this Decision;
	(b) for additional contaminants, not listed in Regulation (EC) No 1881/2006, threshold values, which Member States shall establish through regional or subregional cooperation.
Descriptor 10	□ D10C1 – Primary:
	The composition, amount and spatial distribution of litter on the coastline, in the surface layer of the water column, and on the seabed, are at levels that do not cause harm to the coastal and marine environment.
	Member States shall establish threshold values for these levels through cooperation at Union level, taking into account regional or subregional specificities.
	□ D10C2 — Primary:
	The composition, amount and spatial distribution of micro-litter on the coastline, in the surface layer of the water column, and in seabed sediment, are at levels that do not cause harm to the coastal and marine environment.
	Member States shall establish threshold values for these levels through cooperation at Union level, taking into account regional or subregional specificities.
	□ D10C3 — Secondary:
	The amount of litter and micro-litter ingested by marine animals is at a level that does not adversely affect the health of the species concerned. Member States shall establish threshold values for these levels through regional or subregional cooperation.
	□ D10C4 — Secondary:
	The number of individuals of each species which are adversely affected due to litter, such as by entanglement, other types of injury or mortality, or health effects. Member States shall establish threshold values for the adverse effects of litter, through regional or subregional cooperation.
Descriptor 11	□ D11C1 – Primary:
	The spatial distribution, temporal extent, and levels of anthropogenic impulsive sound sources do not exceed levels that adversely affect populations of marine animals.
	Member States shall establish threshold values for these levels through cooperation at Union level, taking into account regional or subregional specificities.
	□ D11C2 – Primary:
	The spatial distribution, temporal extent and levels of anthropogenic continuous low-frequency sound do not exceed levels that adversely affect populations of marine animals.
	Member States shall establish threshold values for these levels through cooperation at Union level, taking into account regional or subregional specificities.
