b.2 BSAP so The sub-programm	egments me serves the following BSAP segments. Tick one or more relevant boxes.
⊠Eutrophication	١
☐ Hazardous sub	ostances
⊠Biodiversity	
☐ Maritime activ	vities
b.3 Monito	ring strategy description
	tegy : Monitoring is to be carried out to fulfill assessment requirements of cal objectives that are specified through HELCOM core indicators. The requirements an include number of stations, the sampling frequency and replication.
	cological objectives nost relevant option(s). Tick one or more boxes below.
Eutrophication	☐ Concentrations of nutrients close to natural levels
	☐ Clear water
	☐ Natural level of algal blooms
	oxtimes Natural distribution and occurrence of plants and animals
	☐ Natural oxygen levels
Hazardous substances	\square Concentrations of hazardous substances close to natural levels
Jubstalles	\square All fish safe to eat
	☐ Healthy wildlife

 $\ oxdot$ Thriving and balanced communities of plants and animals

 \square Radioactivity at pre-Chernobyl levels

 \square Natural landscapes and seascapes

 $\ oxdot$ Viable populations of species

 $\hfill\square$ No illegal pollution

Biodiversity

Maritime

activities	☐ Safe maritime traffic without accidental pollution
	☐ Efficient response capability
	\square No introductions of alien species from ships
	\square Minimum air pollution from ships
	☐ Zero discharges from offshore platforms
In relation to the sufficient covera	n monitoring e GES criteria addressed, indicate when sufficient monitoring was in place or by when age will be in place (Coverage_GEScriteria)
☐ Adequate mo	onitoring was in place in 2014
☐ Adequate mo	onitoring was in place by 2018
☐ Adequate mo	onitoring is in place by July 2020
⊠ Adequate mo	onitoring will be in place by 2024
☐ Monitoring is	not being put in place for this descriptor due to a low risk

Description of the implementation gaps and plans to complete the establishment and implementation of this descriptor monitoring strategy (Gaps_Plans):

☐ Monitoring for this descriptor is not relevant

Regular monitoring is implemented in form of coastal counts only. Coordinated coverage of offshore parts has been initiated but is not implemented on a regular basis. Implementation varies and thus representative coverage is not secured. The current form of monitoring hence does not support assessments of all true marine species which do not occur in representative proportions in coastal waters. Seaducks (Common Eider, Long-tailed Duck, Common Scoter, Velvet Scoter), grebes (Red-necked Grebe, Slavonian Grebe) and divers (Red-throated Diver, Black-throated Diver) are not considered in the current assessments. All of these species however have to be considered as indicator species of marine health. Thus, the monitoring needs to be extended to enable inclusion of these species in future assessments. Experts have suggested improvements in offshore monitoring in the Baltic Sea during the winter. In addition, there is an attempt to evaluate the usefulness of spring migration count data from bird observatories in Gulf of Finland as the estimate of annual abundance changes of the long-tailed duck winter population. Future monitoring also needs to take into account that the Northern Baltic Sea will stay ice free more frequently due to general climate warming. Thus, in order to monitor total Baltic populations, there has to be readiness for spatially larger-scale censuses than nowadays. Additional coordination efforts by JWGBIRD experts inducing synchronization of national survey efforts should be enhanced by building a platform for seabird monitoring in the Baltic. Common guidelines and a common database are currently under preparation.

c. Monitoring programmes

c.1 Purpose of monitoring

c.1a Assessment purpose in general

The programme supports the assessment of:

T: -1.	41		levant	I
LICK	the	r٩	Ievant.	nox

Tomporal tronds	Spatial distribution	State classification
Temporal trends	Spatial distribution	State classification
	\boxtimes	

The **programme** supports the assessment of: (MonitoringPurpose).

Note that the answer to this question will be decisive for whether to answer upcoming questions e.g. upcoming questions on pressures should only be answered if the monitoring is defined as supporting the assessment of pressures.

Tick the relevant boxes.

Environmental state and impacts	Pressures in the marine environment	Pressures at source (land-based, riverine, sea-based ¹ and atmospheric sources)	Human activities causing the pressures	Effectiveness of measures
If this is selected fill in the following questions: c.1b	If this is selected fill in the following questions: c.1c, d	If this is selected fill in the following questions: c.1c, d	If this is selected fill in the following questions: c.1c, d	If this is selected fill in the following questions: c.1c, d

Give any other monitoring purpose e.g. if the programmes include supporting parameters for other monitoring programmes

Gives input to status assessments under BD.	

For questions 1b-1d, select when applicable for the sub-programme, the link from the Reporting on the 2020 update of Article 11 for the Marine Strategy Framework Directive (MSFD Guidance Document 17, 2020) (Features) to:

- Ecosystem components (relevant for monitoring and assessment for Article 8(1a) for D1C2-C5, D3, D4, D6C3-C5, D7C2)
- Pressures and impacts in the marine environment (relevant for monitoring and assessment for Article 8(1b) for D1C1, D2, D5, D6C1-C2, D7C1, D8, D9, D10, D11)
- Pressure inputs to the marine environment (relevant for monitoring and assessment for Article 10)
- Uses and human activities (relevant for monitoring and assessment for Article 8(1c) and 13)

¹ Sea-based 'Pressures at source' refers to monitoring pressures from sea-based activities where the monitoring is directly at the activity rather than at a distance from or time period after it is generated by the activity (e.g. D1 incidental by-catch when fishing, D2 ballast water discharges, D6 use of bottom fishing gear, D8 contaminant discharges and pollution events from a vessel or pipeline, D11 impulsive sound events from a vessel or platform).

PARAMETER

Element/Parameter pair

Wintering birds/Population size (abundance)

METHOD (MonitoringDetails)

Wintering birds/Population size (abundance)

Ground count based coastal surveys by volunteers, offshore surveys by plane and ship (including digital surveys).

QA/QC

Wintering birds/Population size (abundance)

National, but guidelines from the Wetlands International are used, common guidelines for offshore monitoring in preparation.

FREQUENCY

Frequency

Wintering birds/Population size (abundance)

Coastal counts at least yearly. The temporal resolution of the monitoring of wintering birds varies greatly among the countries. Data is available from the year 1991. Offshore counts aimed for every 3-6 years.

In Finland winter bird census has been organized by LUOMUS (Finnish Museum of Natural History); the first censuses were done as early as the mid-1950s.

SPATIAL SCOPE

Spatial Scope

Wintering birds/Population size (abundance)

Different spatial scope in different countries.

SPATIAL RESOLUTION (DENSITY) OF SAMPLING

Spatial resolution

Wintering birds/Population size (abundance)

Spatial resolution varies between countries and specific parts within the country waters depending on site importance for wintering waterbirds

Provide considerations for the scale of aggregation of data for an indicator-based assessment Ticone or more relevant boxes below:

c.7 MSFD Criteria (GES criteria) Choose only the most relevant option(s). Tick one or more boxes below.

Descriptor 1	□ D1C1 – Primary:
	The mortality rate per species from incidental by-catch is below levels which threaten the species, such that its long- term viability is ensured.
	Member States shall establish the threshold values for the mortality rate from incidental by-catch per species, through regional or subregional cooperation.
	☑ D1C2 – Primary:
	The population abundance of the species is not adversely affected due to anthropogenic pressures, such that its long-term viability is ensured.
	Member States shall establish threshold values for each species through regional or subregional cooperation, taking account of natural variation in population size and the mortality rates derived from D1C1, D8C4 and D10C4 and other relevant pressures. For species covered by Directive 92/43/EEC, these values shall be consistent with the Favourable Reference Population values established by the relevant Member States under Directive 92/43/EEC.
	$\hfill\Box$ D1C3 — Primary for commercially- exploited fish and cephalopods and secondary for other species:
	The population demographic characteristics (e.g. body size or age class structure, sex ratio, fecundity, and survival rates) of the species are indicative of a healthy population which is not adversely affected due to anthropogenic pressures.
	Member States shall establish threshold values for specified characteristics of each species through regional or subregional cooperation, taking account of adverse effects on their health derived from D8C2, D8C4 and other relevant pressures.
	\boxtimes D1C4 – Primary for species covered by Annexes II, IV or V to Directive 92/43/EEC and secondary for other species:
	The species distributional range and, where relevant, pattern is in line with prevailing physiographic, geographic and climatic conditions.
	Member States shall establish threshold values for each species through regional or subregional cooperation. For species covered by Directive 92/43/EEC, these shall be consistent with the Favourable Reference Range values established by the relevant Member States under Directive 92/43/EEC.
	$\hfill\Box$ D1C5 — Primary for species covered by Annexes II, IV and V to Directive 92/43/EEC and secondary for other species:
	The habitat for the species has the necessary extent and condition to support the different stages in the life history of the species.
	☐ D1C6 – Primary
	The condition of the habitat type, including its biotic and abiotic structure and its functions (e.g. its typical species composition and their relative abundance, absence of particularly sensitive or fragile species or species providing a key function, size structure of species), is not adversely affected due to anthropogenic pressures.
	Member States shall establish threshold values for the condition of each habitat type, ensuring compatibility with related values set under Descriptors 2, 5 and 8, through regional or subregional cooperation.

Descriptor 2	□ D2C1 – Primary:
Descriptor 2	The number of non-indigenous species which are newly introduced via human activity into the wild, per assessment period (6 years), measured from the reference year as reported for the initial assessment under Article 8(1) of Directive 2008/56/EC, is minimised and where possible reduced to zero.
	Member States shall establish the threshold value for the number of new introductions of non-indigenous species, through regional or subregional cooperation.
	□ D2C2 — Secondary:
	Abundance and spatial distribution of established non-indigenous species, particularly of invasive species, contributing significantly to adverse effects on particular species groups or broad habitat types.
	□ D2C3 — Secondary:
	Proportion of the species group or spatial extent of the broad habitat type which is adversely altered due to non-indigenous species, particularly invasive non-indigenous species.
	Member States shall establish the threshold values for the adverse alteration to species groups and broad habitat types due to non-indigenous species, through regional or subregional cooperation.
Descriptor 3	□ D3C1 — Primary:
	The Fishing mortality rate of populations of commercially-exploited species is at or below levels which can produce the maximum sustainable yield (MSY). Appropriate scientific bodies shall be consulted in accordance with Article 26 of Regulation (EU) No 1380/2013.
	□ D3C2 — Primary:
	The Spawning Stock Biomass of populations of commercially-exploited species are above biomass levels capable of producing maximum sustainable yield. Appropriate scientific bodies shall be consulted in accordance with Article 26 of Regulation (EU) No 1380/2013.
	□ D3C3 — Primary:
	The age and size distribution of individuals in the populations of commercially-exploited species is indicative of a healthy population. This shall include a high proportion of old/large individuals and limited adverse effects of exploitation on genetic diversity.
	Member States shall establish threshold values through regional or subregional cooperation for each population of species in accordance with scientific advice obtained pursuant to Article 26 of Regulation (EU) No 1380/2013.
Descriptor 4	□ D4C1 — Primary:
	The diversity (species composition and their relative abundance) of the trophic guild is not adversely affected due to anthropogenic pressures.
	Member States shall establish threshold values through regional or subregional cooperation.
	☑ D4C2 — Primary:

	The balance of total abundance between the trophic guilds is not adversely affected due to anthropogenic pressures.
	Member States shall establish threshold values through regional or subregional cooperation.
	□ D4C3 — Secondary:
	The size distribution of individuals across the trophic guild is not adversely affected due to anthropogenic pressures.
	Member States shall establish threshold values through regional or subregional cooperation.
	\square D4C3 — Secondary (to be used in support of criterion D4C2, where necessary):
	Productivity of the trophic guild is not adversely affected due to anthropogenic pressures.
	Member States shall establish threshold values through regional or subregional cooperation.
Descriptor 5	□ D5C1 — Primary:
	Nutrient concentrations are not at levels that indicate adverse eutrophication effects.
	The threshold values are as follows:
	(a) in coastal waters, the values set in accordance with Directive 2000/60/EC;
	(b) beyond coastal waters, values consistent with those for coastal waters under Directive 2000/60/EC. Member States shall establish those values through regional or subregional cooperation
	□ D5C2 — Primary:
	Chlorophyll a concentrations are not at levels that indicate adverse effects of nutrient enrichment.
	The threshold values are as follows:
	(c) in coastal waters, the values set in accordance with Directive 2000/60/EC;
	(d) beyond coastal waters, values consistent with those for coastal waters under Directive 2000/60/EC. Member States shall establish those values through regional or subregional cooperation.
	□ D5C3 — Secondary:
	The number, spatial extent and duration of harmful algal bloom events are not at levels that indicate adverse effects of nutrient enrichment.
	□ D5C4 — Secondary:
	The photic limit (transparency) of the water column is not reduced, due to increases in suspended algae, to a level that indicates adverse effects of nutrient enrichment.
	The threshold values are as follows:
	(e) in coastal waters, the values set in accordance with Directive 2000/60/EC;
	(f) beyond coastal waters, values consistent with those for coastal waters under Directive 2000/60/FC. Member States shall establish those values through

	regional or subregional cooperation.
	\square D5C5 — Primary (may be substituted by D5C8):
	The concentration of dissolved oxygen is not reduced, due to nutrient enrichment, to levels that indicate adverse effects on benthic habitats (including on associated biota and mobile species) or other eutrophication effects.
	The threshold values are as follows:
	(g) in coastal waters, the values set in accordance with Directive 2000/60/EC;
	(h) beyond coastal waters, values consistent with those for coastal waters under Directive 2000/60/EC. Member States shall establish those values through regional or subregional cooperation.
	□ D5C6 — Secondary:
	The abundance of opportunistic macroalgae is not at levels that indicate adverse effects of nutrient enrichment.
	The threshold values are as follows:
	(a) in coastal waters, the values set in accordance with Directive 2000/60/EC;
	(b) should this criterion be relevant for waters beyond coastal waters, values consistent with those for coastal waters under Directive 2000/60/EC. Member States shall establish those values through regional or subregional cooperation.
	□ D5C7 — Secondary:
	The species composition and relative abundance or depth distribution of macrophyte communities achieve values that indicate there is no adverse effect due to nutrient enrichment including via a decrease in water transparency, as follows:
	(a) in coastal waters, the values set in accordance with Directive 2000/60/EC;
	(b) should this criterion be relevant for waters beyond coastal waters, values consistent with those for coastal waters under Directive 2000/60/EC. Member States shall establish those values through regional or subregional cooperation.
	\square D5C8 — Secondary: (except when used as a substitute for D5C5):
	The species composition and relative abundance of macrofaunal communities, achieve values that indicate that there is no adverse effect due to nutrient and organic enrichment, as follows:
	(a) in coastal waters, the values for benthic biological quality elements set in accordance with Directive 2000/60/EC;
	(b) beyond coastal waters, values consistent with those for coastal waters under Directive 2000/60/EC. Member States shall establish those values through regional or subregional cooperation.
Descriptor 6	□ D6C1 – Primary:
	Spatial extent and distribution of physical loss (permanent change) of the natural seabed.
	□ D6C2 – Primary:
	Spatial extent and distribution of physical disturbance pressures on the seabed.

	□ D6C3 – Primary:
	Spatial extent of each habitat type which is adversely affected, through change in its biotic and abiotic structure and its functions (e.g. through changes in species composition and their relative abundance, absence of particularly sensitive or fragile species or species providing a key function, size structure of species), by physical disturbance.
	Member States shall establish threshold values for the adverse effects of physical disturbance, through regional or subregional cooperation.
	☐ D6C4 – Primary:
	The extent of loss of the habitat type, resulting from anthropogenic pressures, does not exceed a specified proportion of the natural extent of the habitat type in the assessment area.
	Member States shall establish the maximum allowable extent of habitat loss as a proportion of the total natural extent of the habitat type, through cooperation at Union level, taking into account regional or subregional specificities.
	□ D6C5 – Primary:
	The extent of adverse effects from anthropogenic pressures on the condition of the habitat type, including alteration to its biotic and abiotic structure and its functions (e.g. its typical species composition and their relative abundance, absence of particularly sensitive or fragile species or species providing a key function, size structure of species), does not exceed a specified proportion of the natural extent of the habitat type in the assessment area.
	Member States shall establish threshold values for adverse effects on the condition of each habitat type, ensuring compatibility with related values set under Descriptors 2, 5, 6, 7 and 8, through cooperation at Union level, taking into account regional or subregional specificities. Member States shall establish the maximum allowable extent of those adverse effects as a proportion of the total natural extent of the habitat type, through cooperation at Union level, taking into account regional or subregional specificities.
Descriptor 7	□ D7C1 – Secondary:
	Spatial extent and distribution of permanent alteration of hydrographical conditions (e.g. changes in wave action, currents, salinity, temperature) to the seabed and water column, associated in particular with physical loss(1) of the natural seabed.
	□ D7C2 – Secondary:
	Spatial extent of each benthic habitat type adversely affected (physical and hydrographical characteristics and associated biological communities) due to permanent alteration of hydrographical conditions.
Descriptor 8	□ D8C1 – Primary:
	Within coastal and territorial waters, the concentrations of contaminants do not exceed the following threshold values:
	(a) for contaminants set out under point 1(a) of criteria elements, the values set in accordance with Directive 2000/60/EC;

(c) for additional contaminants selected under point 1(b) of criteria elements, the concentrations for a specified matrix (water, sediment or biota) which may give rise to pollution effects. Member States shall establish these concentrations through regional or subregional cooperation, considering their application within and beyond coastal and territorial waters. Beyond territorial waters, the concentrations of contaminants do not exceed the following threshold values: (a) for contaminants selected under point 2(a) of criteria elements, the values as applicable within coastal and territorial waters; (b) for contaminants selected under point 2(b) of criteria elements, the concentrations for a specified matrix (water, sediment or biota) which may give rise to pollution effects. Member States shall establish these concentrations through regional or subregional cooperation. D8C2 – Secondary: The health of species and the condition of habitats (such as their species composition and relative abundance at locations of chronic pollution) are not adversely affected due to contaminants including cumulative and synergetic effects. Member States shall establish those adverse effects and their threshold values through regional or subregional cooperation. D8C3 – Primary: The spatial extent and duration of significant acute pollution events are minimised. D8C4 – Secondary (to be used when a significant acute pollution event has occurred): The adverse effects of significant acute pollution events on the health of species and on the condition of habitats (such as their species composition and relative abundance) are minimised and, where possible, eliminated. Descriptor 9 D9C1 – Primary: The level of contaminants in edible tissues (muscle, liver, roe, flesh or other soft parts, as appropriate) of seafood (including fish, crustaceans, molluscs, echinoderms, seawed and other marine plants) caught or harvested in the wild (excluding fin-fish from mariculture) does not exceed: (a) for contaminants listed in Regulation		(b) when contaminants under point (a) are measured in a matrix for which no value is set under Directive 2000/60/EC, the concentration of those contaminants in that matrix established by Member States through regional or subregional cooperation;
following threshold values: (a) for contaminants selected under point 2(a) of criteria elements, the values as applicable within coastal and territorial waters; (b) for contaminants selected under point 2(b) of criteria elements, the concentrations for a specified matrix (water, sediment or biota) which may give rise to pollution effects. Member States shall establish these concentrations through regional or subregional cooperation. D8C2 – Secondary: The health of species and the condition of habitats (such as their species composition and relative abundance at locations of chronic pollution) are not adversely affected due to contaminants including cumulative and synergetic effects. Member States shall establish those adverse effects and their threshold values through regional or subregional cooperation. D8C3 – Primary: The spatial extent and duration of significant acute pollution events are minimised. D8C4 – Secondary (to be used when a significant acute pollution event has occurred): The adverse effects of significant acute pollution events on the health of species and on the condition of habitats (such as their species composition and relative abundance) are minimised and, where possible, eliminated. Descriptor 9 D9C1 – Primary: The level of contaminants in edible tissues (muscle, liver, roe, flesh or other soft parts, as appropriate) of seafood (including fish, crustaceans, molluscs, echinoderms, seaweed and other marine plants) caught or harvested in the wild (excluding fin-fish from mariculture) does not exceed: (a) for contaminants listed in Regulation (EC) No 1881/2006, the maximum levels laid down in that Regulation, which are the threshold values for the purposes of this Decision; (b) for additional contaminants, not listed in Regulation (EC) No 1881/2006, threshold values, which Member States shall establish through regional or		concentrations for a specified matrix (water, sediment or biota) which may give rise to pollution effects. Member States shall establish these concentrations through regional or subregional cooperation, considering their application
applicable within coastal and territorial waters; (b) for contaminants selected under point 2(b) of criteria elements, the concentrations for a specified matrix (water, sediment or biota) which may give rise to pollution effects. Member States shall establish these concentrations through regional or subregional cooperation. □ D8C2 – Secondary: The health of species and the condition of habitats (such as their species composition and relative abundance at locations of chronic pollution) are not adversely affected due to contaminants including cumulative and synergetic effects. Member States shall establish those adverse effects and their threshold values through regional or subregional cooperation. □ D8C3 – Primary: The spatial extent and duration of significant acute pollution events are minimised. □ D8C4 – Secondary (to be used when a significant acute pollution event has occurred): The adverse effects of significant acute pollution events on the health of species and on the condition of habitats (such as their species composition and relative abundance) are minimised and, where possible, eliminated. Descriptor 9 □ D9C1 – Primary: The level of contaminants in edible tissues (muscle, liver, roe, flesh or other soft parts, as appropriate) of seafood (including fish, crustaceans, molluscs, echinoderms, seaweed and other marine plants) caught or harvested in the wild (excluding fin-fish from mariculture) does not exceed: (a) for contaminants listed in Regulation (EC) No 1881/2006, the maximum levels laid down in that Regulation, which are the threshold values for the purposes of this Decision; (b) for additional contaminants, not listed in Regulation (EC) No 1881/2006, threshold values, which Member States shall establish through regional or		
concentrations for a specified matrix (water, sediment or biota) which may give rise to pollution effects. Member States shall establish these concentrations through regional or subregional cooperation. D8C2 – Secondary: The health of species and the condition of habitats (such as their species composition and relative abundance at locations of chronic pollution) are not adversely affected due to contaminants including cumulative and synergetic effects. Member States shall establish those adverse effects and their threshold values through regional or subregional cooperation. D8C3 – Primary: The spatial extent and duration of significant acute pollution events are minimised. D8C4 – Secondary (to be used when a significant acute pollution event has occurred): The adverse effects of significant acute pollution events on the health of species and on the condition of habitats (such as their species composition and relative abundance) are minimised and, where possible, eliminated. Descriptor 9 D9C1 – Primary: The level of contaminants in edible tissues (muscle, liver, roe, flesh or other soft parts, as appropriate) of seafood (including fish, crustaceans, molluscs, echinoderms, seaweed and other marine plants) caught or harvested in the wild (excluding fin-fish from mariculture) does not exceed: (a) for contaminants listed in Regulation (EC) No 1881/2006, the maximum levels laid down in that Regulation, which are the threshold values for the purposes of this Decision; (b) for additional contaminants, not listed in Regulation (EC) No 1881/2006, threshold values, which Member States shall establish through regional or		•

	-
Descriptor 10	□ D10C1 – Primary:
	The composition, amount and spatial distribution of litter on the coastline, in the surface layer of the water column, and on the seabed, are at levels that do not cause harm to the coastal and marine environment.
	Member States shall establish threshold values for these levels through cooperation at Union level, taking into account regional or subregional specificities.
	□ D10C2 — Primary:
	The composition, amount and spatial distribution of micro-litter on the coastline, in the surface layer of the water column, and in seabed sediment, are at levels that do not cause harm to the coastal and marine environment.
	Member States shall establish threshold values for these levels through cooperation at Union level, taking into account regional or subregional specificities.
	□ D10C3 — Secondary:
	The amount of litter and micro-litter ingested by marine animals is at a level that does not adversely affect the health of the species concerned. Member States shall establish threshold values for these levels through regional or subregional cooperation.
	□ D10C4 — Secondary:
	The number of individuals of each species which are adversely affected due to litter, such as by entanglement, other types of injury or mortality, or health effects. Member States shall establish threshold values for the adverse effects of litter, through regional or subregional cooperation.
Descriptor 11	□ D11C1 – Primary:
	The spatial distribution, temporal extent, and levels of anthropogenic impulsive sound sources do not exceed levels that adversely affect populations of marine animals.
	Member States shall establish threshold values for these levels through cooperation at Union level, taking into account regional or subregional specificities.
	□ D11C2 – Primary:
	The spatial distribution, temporal extent and levels of anthropogenic continuous low-frequency sound do not exceed levels that adversely affect populations of marine animals.
	Member States shall establish threshold values for these levels through cooperation at Union level, taking into account regional or subregional specificities.
